

"SPMAGTF(X)" in the context of the US Marine Corps refers to a "Special Purpose Marine Air-Ground Task Force (Experimental)," a unit tailored for specific, experimental, or crisis response missions. [🔗](#)

Here's a more detailed explanation:

SPMAGTF (Special Purpose Marine Air-Ground Task Force):

These are Marine Corps units designed for specific, non-standard missions, often involving crisis response, contingency operations, theater security cooperation, and enabling operations. [🔗](#)

SPMAGTF(X) (Experimental):

The "(X)" designation indicates that this particular SPMAGTF is focused on experimentation, testing new capabilities, and developing future operational concepts. [🔗](#)

MAGTF (Marine Air-Ground Task Force):

A MAGTF is the Marine Corps' primary unit for conducting operations, integrating air, ground, and logistics capabilities. [🔗](#)

SPMAGTF-CR (Crisis Response):

These are Marine Corps units tailored to conduct crisis response, contingency operations, theater security cooperation, enabling operations, and all other missions as may be directed throughout their assigned

Story by By Sgt. Chris W. Cox

FINDINGS RELEASED ON HUNTER WARRIOR ADVANCED WARFIGHTING EXPERIMENT

MARINE CORPS BASE QUANTICO, Va. -- In the largest experiment to date by the newly-renamed Marine Corps Warfighting Laboratory here, ways were explored that would increase the area of influence and combat effectiveness of Marine units.

The Hunter Warrior Advanced Warfighting Experiment, which was conducted in March at Marine Corps Air Ground Combat Center, Twentynine Palms, Calif., took a look at enhancing Marine units' effectiveness by utilizing a combination of experimental equipment and new warfighting tactics and techniques.

INDOPACOM Intelligence Vessels Positioned to Collect on Reproduction Vehicle: On USG networks, there exists Infrared footage of an equilateral-triangle UAP hovering over a specific area of the Pacific Ocean. In this footage, which was in close-proximity to the vessels, a large equilateral-triangle UAP suddenly appears directly over the ships. Three bright lights are seen at each bottom corner of the UAP, which is observed to slowly rotate on its horizontal axis. This rotation partially reveals a horizontal bar of sweeping lights. Intelligence analysis associated with this event specifies that the equilateral triangle is a Reproduction Vehicle (RV), and concludes that there must have been a correlation between the RV's frequent use of those coordinates, the positioning of advanced collection assets at the exact time and place. After a brief period of hovering and slowly rotating approximately 500-1000 meters above the ocean, the RV suddenly disappears, and the footage ends.

3 / 12

INDOPACOM Equilateral Triangle UAP Tails Unwitting Vessel: On USG networks, there exists infrared footage of an equilateral-triangle UAP, approximately fighter-jet sized, hovering less than 200 meters above a vessel, in the night at a location in the Pacific. Intelligence analysis

IMMACULATE

CONSTELLATION

associated with this event specifies that the equilateral-triangle UAP is an ARV/RV of unknown origin. The vessel gives no signs that it is aware of the ARV/RV maintaining altitude and hovering directly overhead. Two lights on the underside of the ARV/RV are visible, while a third is blocked from view due to a slightly upward angle of orientation.

Table 4: Triangular

Observable	Details
Size	Medium to large sized, ranging from F-16 to football-field size.
Speed	Capable of slow, precise movement as well as rapid acceleration to speeds beyond conventional aircraft.
Signatures	Often reported to emit a soft, humming sound; may affect electronic devices within a certain proximity.
Colors	Black or dark gray, sometimes with white lights at the corners and a central red light; reports of "twinkling" stars across surface.

IMMACULATE CONSTELLATION

Observable	Details
Surface Details	Some have been described with visible surface textures, like panels or ridges and occasionally stabilizers.
Behaviors	Hovering is common, as is silent flight. The ability to suddenly vanish and accelerate rapidly is frequently reported.
Unique Emissions	Triangular UAPs often emit focused beams of light. Toroidal light patterns are sometimes observed to emanate from a central point, leading to rapid acceleration or disappearance.
Biological Effects	Long-term psychological effects, such as anxiety or insomnia, have been noted alongside the feeling of 'being watched' or shared awareness with the triangular UAP.
