[REDACTED] on MILABs

>And, now for [REDACTED] response. Enjoy it, as much as I did.
>KK

>-----
>From: [REDACTED]
>To: [REDACTED]
>Subject: [REDACTED]
>Date: Monday, April 12, 1999 7:10PM

>Dear [REDACTED],

>Let me begin by saying hello, and reminding you of our quick meeting at
>Laughlin, Nevada, at the same time you met with [REDACTED]. I
>recognized
>you, as I had previously met with you, and heard you speak, at the
>California
>Institute of Human Science on May 2nd of last year. I am impressed with
>your
>charm and social grace, and look forward to meeting again with you
>sometime
>soon.

>Having said that, almost everything you say in the following piece is
>completely full of shit.

>No offense is meant by this statement: in fact, I'm trying to give you
>the
>credit you deserve. I can actually respect evil and deceit for what it
>is,
>but have little sympathy for stupidity and ignorance. Needless to say,
>there
>is much I have little sympathy for, but I have a great deal of respect
>for
>you, sir.

>Respect I have, but that doesn't mean I can't point out the blatant
>fraudhoods you are spreading here. Your Jedi mind tricks may work on
>the
>dull-brained (which means you have an almost endless supply of readers
>for
>your books) but they will not work on me. I know you are quite charming
>from
>our personal chats: of course, most insist the same of Bill Clinton, who
>is
>supposedly able to charm the pants off of anyone (although, if the

>allegations of [REDACTED] are true, that hardly matters in his
>attempts at sexual conquest.) Most pathological liars are charming, it
>is a
>virtue that goes hand in hand with the vice. And so, though you are
>quite
>engaging, I am sorry to inform you I must call a spade a spade, and a
>snake a
>snake.
>
>Oh, where do I begin? Let's start from the top, shall we?
>
><<:: [REDACTED] on MILABs :::
>By: [REDACTED], Ph.D.>>
>
>Yes, that's right, a Ph. D. You have a doctoral degree in thanatology,
>the
>study of death, right? This is how you got one of your nicknames - "Dr.
>Doom" - if I am not mistaken. Not that you needed a degree in the
>subject:
>leading Cambodian mercenaries in mass exterminations during Vietnam's
>Operation Phoenix, you've proven yourself no armchair student of the
>subject.
>Just so those reading know why your title of "Doctor" deserves so much
>respect.
>
><<In response to the various comments, I am submitting this commentary
>on
>Military Abductions (MILABs). As with the first response, and contrary
>to
>assertions by [REDACTED], this commentary addresses only his MILABs,
>not
>all abduction cases. Interestingly, most of the respondents who have
>been
>whining on the Internet do not even address the question at hand. That
>is
>human, not alien, interventions.
>
>(Snip)
>
>Again, [REDACTED] has displayed both a lack of understanding of technical
>knowledge and the ability to competently analyze information.
>Unfortunately,
>he is not alone. This topic is quite important and is covered in some
>detail
>in my forthcoming book, Future War, Non-Lethal Weapons in
>Twenty-First-Century Warfare (St. Martin's Press, May 1999). However,
>given
>his current position in the Austrian Space Research Institute, this
>obvious
>lapse is very disconcerting.>>
>
>A nice plug!
>
><<While triangulation technologies have existed for some considerable
>time,
>the devices had a common characteristic. They were relatively large.
>Until
>very recently, they were certainly larger than could be surreptitiously
>subcutaneously hidden in a person's body. They would be too large to go
>undetected by X-ray or MRI examinations. By 1990, the state-of-the-art
>was a
>device about 11mm long and 2 mm in diameter. This was a passive
>transponder
>without an internal power source. While it could be read by external

>devices,
 >they had to be very close, similar to readers that are currently used in
 >stores. Greater distances can be achieved with higher power, or very
 >narrow
 >bandwidth. That means the device would have to be larger to house
 >internal
 >power or, once externally interrogated the information rate very low. It
 >would also have to broadcast above the background noise at the
 >designated
 >frequency. Today, most of the miniaturized location technology is
 >designed to
 >work at a range of feet, not miles. The tradeoffs between, power,
 >frequency,
 >antenna systems, and size make the commonly accepted notion of MILABs
 >highly
 >implausible. Since it is claimed that these military abductions have
 >been
 >taking place for quite a period of time, it must be assumed that older
 >technology was in use. It is noted that [REDACTED] response to [REDACTED]
 >article posted by CAUS does not reference a source earlier than 1996.
 >Yet he
 >wants us to believe these nearly nanoscale, where is this tiny little
 >thing
 >known as "black budget projects," projects which - even if you had the
 >ability or desire to present facts in an honest matter, and you
 >apparently
 >don't - would require you to remain silent about them or face punishment
 >for
 >revealing information that threatens "national security." Therefore,
 >your
 >statement, "They have not," has no value whatsoever, as you are required
 >to
 >say it, even if the answer is "They have."
 >
 >However, let me add some things that you should be aware of. For many
 >years,
 >the ability to keep track of cars has been done courtesy of implanted
 >tracking systems connected to satellites. Further, a recent animal
 >identification system, the American Veterinary Identification Devices
 >(AVID),
 >allows tiny microchips to be implanted in animals, who can later be
 >scanned
 >to identify owners. As an L.A. Times article on AVID ends:
 >
 >
 >Not all pet owners are expected to embrace the concept, said Nylund.
 >Already, a few people at public hearings have recoiled at the political
 >implications of this technology. "There is something spooky about it,
 >and
 >everyone realizes it," he said.
 >
 >
 >Though the chips aren't used to keep track of the pets via satellite, it
 >doesn't take a Ph.D. in the study of death to know that the combination
 >of
 >these two technologies seems quite logical. Further, it's quite
 >impressive
 >that car-trackers and veterinarians are on the cutting edge of using a
 >technology that the US military has absolutely no interest in using on
 >humans
 >themselves, since it is not only immoral but illegal. It turns out that
 >the
 >Pentagon does have some sort of interest and can combine these
 >technologies,

>even officially: the Technology Branch of Eglin Air Force Base (which is
 >a
 >key client of Calspan, the private firm that coincidentally employed
 >Timothy
 >McVeigh when he started claiming, foolishly of course, that he had a
 >microchip implanted in his butt) is using tiny microchips to track
 >mammals of
 >some sort, namely dolphins. Of course, tracking dolphins is legal, so
 >it is
 >acceptable for the Pentagon to proudly announce it is a press release.
 >Tracking humans (unless they are criminals) is not considered
 >acceptable, but
 >the technology certainly exists.
 >
 > Another LA Times piece, titled "The Future Is Now," listed ten
 >cutting-edge
 >technologies made possible by the microprocessor, as compiled by W.
 >Michael
 >Cox, chief economist for the Federal Reserve Bank of Dallas. Included
 >in the
 >ten listed was "Global Positioning: Using satellites to pinpoint
 >positions."
 >Among the uses for this technology listed were to "pinpoint cars,
 >missing
 >children, pets." The best place to hide something sinister is in the
 >middle,
 >and odd that this is where "missing children" is mentioned. I suppose,
 >assuming the tracking of children will eventually be done by chip, that
 >these
 >chips will include some capabilities to be shut off when the child turns
 >eighteen, since of course it is only for children and not adults.
 >
 >I'll leave it to others to decide if respect for law and ethical
 >considerations exceed the DOD's desire to exploit technologies to their
 >fullest. I'll also leave it to others to grapple with the question of
 >if
 >what has been reported in the mainstream press and Air Force PR
 >represents
 >the highest levels of technological advancement or not.
 >
 >Maybe this helps clarify some things, doc. Frankly, I hope you are
 >lying in
 >your above comments. If not, you display both a lack of understanding
 >of
 >technical knowledge and the ability to competently analyze information,
 >and
 >given your current position as Director of "Non-lethal Weapons"
 >Department in
 >the Los Alamos National Laboratories, this obvious lapse is very
 >disconcerting.
 >
 ><<Attempts to locate persons who are free to move about at substantial
 >distances infer that the interception capability is quite mobile.
 >Therefore,
 >it would be logical to assume space-based systems, or airborne
 >platforms, are
 >involved. As previously noted, the space-based systems were not
 >available
 >when the incidents began. However, his article does mention that "MILAB
 >victims are harassed by dark, unmarked helicopters" that are seen in the
 >area. It seems incongruent that abductions must take place discretely,
 >yet
 >helicopters are sent to openly harass them.>>
 >

>Space-based systems would be quite available through black budget
 >projects.
 >I believe there's been this thing for years known as "satellites" that
 >you
 >should look into. As for the black choppers, well, as incongruent as it
 >seems, they are reported in thoroughly-examined cases, like it or not.
 >They
 >do form an excellent extra layer of harassment for psychological
 >warfare:
 >apparently it is worth the extra investment to some.
 >
 ><<Even if this mystical and unattained technology were available, the
 >organizational aspects are illogical. If the three-car system proposed
 >by
 >Lammer were used by the offenders, the logic still fails. Assuming there
 >are
 >a minimum of two people per car, and we know that it takes five shifts
 >to man
 >any given position, we are led to assume that 30 people are assigned to
 >continuously track each MILAB. Of course, that doesn't count supervisors
 >and
 >administrative personnel. Remember the helicopters. Where did they come
 >from?
 >Who flew them? Who conducted the medical tests? Who maintained these
 >yet-to-be-identified bases? The list of involved personnel goes on and
 >on.
 >Since it is claimed that these illegal operations have been conducted
 >for
 >many years, and since military personnel rotate on a frequent basis,
 >there
 >would have to be thousands, if not tens of thousands, of people involved
 >over
 >time. Where are they? When you add up all of the people who say they are
 >MILAB victims, the number of people involved in this operation would be
 >non-trivial. At a time when military strength is cut to the bone, are we
 >to
 >believe this mission-without-purpose takes precedence over other
 >critical
 >functions? With all of the questionable projects that have been exposed,
 >why
 >have we not heard from one whistleblower about MILAB? The reason is
 >because
 >it does not exist, nor has it ever existed.>>
 >
 >To begin with, the cars would not have to monitor the people 24 hours:
 >their
 >whereabouts are known, since they have been supposedly implanted with
 >microchips. Surveillance could switch from one person to another, so
 >the
 >numbers given aren't necessarily accurate. The helicopter, the medical
 >test,
 >the bases and personnel all could come quite easily from those
 >associated
 >with the military-industrial complex. Still, let us just assume ten
 >thousand
 >people are involved in this project (as you allege in a worst case
 >scenario),
 >and say that costs beyond normal defense costs per person is a hundred
 >thousand, an unlikely high amount. Multiply that out, and you have one
 >billion dollars. Is that an outrageous amount to use as a test to study
 >how
 >to manipulate and control people? No, and the Pentagon does have it in
 >their
 >black budgets. They even have it in their regular budget, which is not,

>as
 >you insist, "cut to the bone" but still quite padded at over \$250
 >billion.
 >
 >Finally, such projects, being gross violations of human rights, would be
 >heavily secret, the participants heavily screened beforehand, and anyone
 >who
 >squealed on them would either be killed or "Oliver Stoned" with
 >criticism for
 >speaking out on such a dangerous taboo, whichever was easier. This
 >makes
 >whistleblowing unenjoyable at best, quite dangerous at worst.
 >
 ><<It must also be noted that not one implanted transmitter has been
 >recovered. According to the MILAB theory proposed, location and
 >extraction of
 >such a device would be a simple matter. None of the "alien implant"
 >work,
 >such as that done by [REDACTED], has found anything remotely associated
 >with
 >a human designed transmitter. The systems described in Lammer's article
 >for
 >use in monitoring criminals are quite large when compared with some
 >unknown
 >subcutaneous version and are generally tracked by fixed sources. This is
 >hardly what the "abductees" have described. Where are these devices?>>
 >
 >I'll let [REDACTED] answer this himself: but the transmitters he has found
 >most
 >certainly could be designed by humans, whether or not "aliens" are
 >involved
 >or not.
 >
 ><<Had such technology been available (and it was not), then the analogy
 >between abductees and Qadaffi, Noriega, and Saddam Hussein would be
 >apropos.
 >None of these people rose to prominence out of nowhere. They were all
 >identified on their ascendancy, and at a time when there was physical
 >access
 >to them. If available, triangulation transponders could have been
 >implanted
 >long before these foreign leaders became problematic.>>
 >
 >You're right, none of these people rose to prominence out of nowhere.
 >They
 >were all identified, and they were all financed and promoted by the
 >military-intelligence community. Qadaffi had a multi-billion dollar
 >nest
 >age, courtesy of the Fiat corporation, which profited hugely off the
 >"Star
 >Wars" defense plan. Noriega was on the CIA payroll as well, and was good
 >chums with George Bush. So was Saddam Hussein, who was financed by our
 >military as well. The reason, of course, is that these individuals were
 >very
 >good for business: the Pentagon always needs a bogeyman to scare the
 >masses.
 >If one doesn't exist, they'll create it instead.
 >
 ><<How current is the analogy of MILABs versus critical national
 >interests? On
 >31 March 1999 three American soldiers were captured near the Yugoslavian
 >border in Macedonia. The incident is making news around the world. It is
 >noted that their exact location at this time can not be determined. Are
 >we to

>assume that some über-secret agency believed it was more important to
 >use
 >this highly advanced technology on unsuspecting civilians - who are of
 >no
 >special interest except to themselves and their friends - than in
 >support of
 >our national security. That logic is certainly seriously flawed.>>
 >
 >"That their exact location at this time can not be determined" is a
 >claim
 >being made by the military, and considering the pathological level of
 >deception involved with the military, it could reasonably assumed to be
 >a
 >lie. Further, your embarrassingly empty argument assumes that three
 >soldiers
 >lives are particularly important to the military establishment, which
 >they
 >most certainly aren't, just as the victims of Agent Orange and Gulf War
 >Syndrome were and are considered quite disposable.
 >
 ><<Lammer's knowledge of "black programs" and how they function is
 >equally
 >lacking. His argument appears to be that if large amounts of money were
 >available, some agency, or even a renegade subelement thereof, would
 >choose
 >to spend money on tracking innocent people. Here there are two key
 >issues to
 >address. First of all, just because a project is "black" doesn't mean
 >there
 >is no oversight. While fewer people have access to the program, in this
 >day
 >and age, dollars are watched quite closely in every project. His notion
 >of
 >the money available is off by at least an order of magnitude. Lammer
 >states
 >that SDI was funded at "tens of billions of US dollars." The reality is
 >that
 >at its zenith, SDI was a \$5 billion dollar program and that has shrunk
 >dramatically over the years. When I proposed a politically sensitive
 >project
 >to Lt. General [REDACTED], then director of SDI, he turned me down.
 >He
 >stated that if he were caught funding that venture, Congress would
 >assume SDI
 >had too much money and would make severe cuts. In fact, SDI was cut \$1
 >billion that year. What I had proposed was nowhere near as risky as
 >illegally
 >kidnapping civilians and physically assaulting them.>>
 >
 >The poor, oppressed Pentagon. I truly shed tears. At least you try to
 >refute the black budget argument, though your anecdote, even if true
 >(and I
 >wouldn't assume that), doesn't explain how scores of devious operations
 >do
 >indeed happen. The fact of the matter is there is little oversight over
 >these kinds of operations, and to get around even the flimsy legalities,
 >many
 >operations are "privatized" in front groups that have no oversight.
 >Also,
 >considering the impressive amount of information the intelligence sector
 >has
 >to blackmail politicians who "oversee" them, not to mention the heavy
 >influence that defense contractors have on politician's campaigns thanks
 >to

>contributions, the likelihood of a politician with any spine or
 >conscience to
 >investigate these matters unlikely.
 >
 ><<The second major problem in his thinking is that such a project makes
 >no
 >sense to anyone-except for a few conspiracy theorists. There is no
 >logical
 >purpose in tracking the people who make these claims. They do not appear
 >to
 >have any significant attributes that would make them worthy of special
 >study.
 >
 >There is no indication that they are extremely intelligent, nor is their
 >physical prowess of note. No Nobel laureate or person of publicly
 >acclaimed
 >accomplishments has ever claimed to be a MILAB. It therefore remains a
 >mystery as to why these relatively nondescript people are reportedly
 >chosen
 >to be unwilling MILAB participants.>>
 >
 >In fact, if you are testing the manipulation of the mind and need guinea
 >pigs, it is the average nobodies you tend to focus on. That's why it is
 >considered a test: you want people who aren't high profile, so as not to
 >attract notice.
 >
 ><<There are, however, many well-known medical conditions that describe
 >these
 >signs and symptoms. These observed or perceived contentions maintain
 >that
 >some person, or group of persons, is after them are indeed found amongst
 >10
 >million persons per year who are seen by clinicians who include social
 >workers, clinical psychologists, neurologists, general practitioners and
 >other primary care practitioners, and sometime by psychiatrists. The
 >vast
 >majority of these persons (over 90%) function very well within
 >activities of
 >daily life. Outside of a narrow, highly circumscribed paranoid delusion,
 >concern, or worry-that while not real-these delusions are not disabling.
 >Most
 >common are beliefs of other entities, voices, bedroom-related visions,
 >and
 >hypnagogic experiences. Often they are accompanied over time by
 >exaggerated
 >notions of self-importance. Clinical estimates are that over 100 million
 >of
 >these persons are alive today worldwide. They are found in all countries
 >and
 >all cultures. Generally speaking, the demography of these persons does
 >not
 >match that of a normal population. These observations are not new. They
 >have
 >been diagnosed, or more likely merely observed, for more than a century.
 >It
 >is a much more simplistic answer than the bizarre scenario being
 >portrayed by
 >Lammer and his supporters. Where is Occam when you need him?>>
 >
 >Occam will also let you know that a natural phenomenon is the perfect
 >cover
 >for testing and projects: after all, crazy people here voices
 >themselves. I
 >have no doubt that many who claim they are victims of MKULTRA-esque

>experiments are insane. There are many who are not. Do I think all
 >-UFO
 >abductions- are military related? No. Some are lies. Others are
 >delusions.
 > Others are some kind of paranormal phenomenon, which could include
 >aliens or
 >hyperdimensional beings. But to believe that the military isn't using
 >this
 >as a cover for sinister operations, when they have the means, the
 >motive, and
 >the history of doing likewise atrocious deeds, is just plain silly.
 >
 ><<The reason that no agency would engage in such a preposterous program
 >is
 >the potential for repercussions versus value added. We can find no value
 >added by unauthorized, illegal monitoring of individuals who are
 >self-proclaimed MILABs. After all, a volunteer program would net better
 >results and at no risk. In this day and age, any agency caught
 >conducting
 >such outrageous experiments as has been postulated would risk both
 >severe
 >personal and organizational consequences. My educated guess is that the
 >organization would be disbanded and individuals sent to jail. Again, a
 >simple
 >cost-benefit analysis completely destroys the logic of conducting such
 >an
 >illegal project.>>
 >
 >How do you disband the Defense Department? How do you disband the CIA?
 >How
 >do you disband the NSA? Your absurd argument pretends someone in
 >authority
 >is attempting to catch anyone, which certainly isn't the case. As you
 >note
 >below, similar things have been done in the past: nothing greater than a
 >wrist slap has ever been administered.
 >
 ><<Both Lammer and Wilson draw analogies between the MILAB victims and
 >unwitting participants in prior unwise Government experiments. It cannot
 >be
 >denied that the system has been abused in the past and that individual's
 >rights were violated. However, in each of the cases listed, a reason for
 >the
 >experiments could be made. In Tuskegee doctors wanted to determine how
 >syphilis would progress if left untreated. Most, but not all,
 >participants in
 >MKULTRA were volunteers who signed statements to that effect. Forgotten
 >in
 >the clamor over those experiments is the grave concern that had been
 >generated by our POWs, who showed signs of "brain washing," when they
 >returned from North Korean camps. The radiation experiments also were
 >conducted in a time of extreme anxiety about the effects of exposure and
 >were
 >based on the concerns for our very national survival. I am not making
 >excuses
 >or apologies for these experiments.>>
 >
 >If you aren't trying to make an excuse or apology for these experiments,
 >you're doing a bad job of it, because, by golly, you just have. You
 >also
 >seem not to be competent in understanding Neuro-Linguistic Programming
 >(which
 >explains how, even after being trained by you in NLP, Al Gore still
 >lacks any

>charm), because if you did, you'd know that a great way to have someone
 >accept an argument is to say it as though you are denying it. Keep in
 >mind,
 >I am not trying to say you are completely full of shit.
 >
 ><<However, in each case, the designers conducted a risk-benefits
 >analysis and
 >chose to proceed. The proposed MILAB projects fail that simple test of
 >common
 >sense. There is just no reason to conduct them.>>
 >
 >The interest is certainly there: it precedes the CIA itself, with a 1934
 >article titled "A Method for Remote Control of Electrical Stimulation of
 >the
 >Nervous System." Then there is Dr. Jose Delgado's 1964 experiment with
 >a
 >stimoeiver that stopped a raging bull in its tracks. Then there is
 >Michael
 >Aquino and his MindWar paper, which argues that Vietnam was lost because
 >manipulation of the masses failed. To control the minds of a populace
 >is the
 >ultimate "non-lethal" weapon, and there is great reason to conduct them
 >(which they have.)
 >
 ><<However, since there is no statute of limitations on kidnapping, I
 >also
 >highly recommend that any person who experiences an abduction at the
 >hands of
 >anyone, including purported government agents, report them to multiple
 >law
 >enforcement agencies. That will insure that no single agency can quash
 >the
 >report. While immediacy would be preferred, old cases also can be
 >filed.>>
 >
 >I wish them luck: it is hard to get officials to investigate crimes that
 >can
 >result in the deaths of the investigators when they seriously look at
 >them.
 >These are the darkest of crimes we are talking about already: please
 >don't
 >kid me and others by trying to tell us murder wouldn't be used to cover
 >them
 >up.
 >
 ><<Surprisingly, Victoria has been attacked for both taking information
 >out of
 >context, and using quotes that are quite long. The intent of quotes was
 >to
 >show the words were accurate. The reason the quotes were extensive was
 >to
 >insure they placed the situation in context. Again, this is an example
 >of
 >internally inconsistent logic by the critics.
 >
 >Finally, the MILAB concoction fails every known test of knowledge,
 >proof, and
 >common sense. Not one scintilla of concrete evidence exists to support
 >the
 >hypothesis. Lammer's arguments fail in technology, political science,
 >military science, government, budget and finance, organizational
 >sociology,
 >and psychology/psychiatry. No one supporting the MILAB hypothesis can
 >explain
