W. J. J. J.

Here's a **shocker**.

According to a new book by [REDACTED] BA in Physics, PhD in Systems Theory), galactic radio pulsars (Pulsars) are part of a vast network of ETI communications beacons.

Am part way through the book, but he makes a compelling case.

And he is not alone.

In 1974 , the New York Post quoted MIT radio astronomer Professor Alan Barrett as wondering whether pulsar signals "might be part of a vast interstellar communications network which we have stumbled upon".

LaViolette writes "Their pulsation patterns are so highly ordered and so incredibly complex that attempts to describe them in terms of natural processes borders on absurdity."

Currently numbering around 1100, pulsars are more accurate than atomic clocks, and transmitting in the broadband radio spectrum once again bypass the SETI charade, which only listens on discrete frequencies.

[REDACTED] was the person that broke the story about the B-2 bomber's electrogravitic propulsion system using T. Townsend Brown's dielectrics several years ago.

The book is called "The Talk of the Galaxy", is somewhat technical and is published by Starlane Publications <http://www.etheric.com>

If this premise is true, then we have incontrovertibly made contact with ET civilizations, and have been doing so since the discovery of pulsars in July 1967.

Think about that!

Regards
