SACRED SCIENCE:
EXPANDING THE BOX EVEN FURTHER

by

Brian O'Leary, Ph.D.*

File

Abstract

Just as in the time of the Renaissance, ignorance, complacency, arrogance, funding fears, debunkery, propaganda, ridicule, and sometimes secrecy seem to be common behaviors among mainstream scientists, journalists and officials regarding inquiry into new science. These factors are so common nowadays we sometimes hardly give it a second thought. I suggest this is the denial phase of the grieving process of the old paradigm. Some of us appear to have moved on to anger, bargaining, depression, and finally acceptance--the other steps of grieving we all seem to need to experience as the new paradigm begins to take shape. The fate of the Mars Observer and inquiry into the Martian anomalies in Cydonia is a good contemporary example of this process.

But even under more favorable social circumstances new science can often limit itself to merely a "bigger box" maintaining only reductionistic and materialistic methods of inquiry. If science is meant to be the quest for the truth, we will all eventually need to participate in the process, taking our power back from a ruling elite. Meanwhile, we would hope that the elite will make public all pertinent information about extraterrestrial intelligence, psychokinesis, free energy, energy medicine, etc., and that the public will be merciful in not prosecuting the perpetrators of secrecy and denial, who might have felt bound by outdated Cold War policy. I call Sacred Science that science which would embrace our own selves as interactive elements of our own experiments.

*Co-Founder, [REDACTED]

Introduction

Over the past several years, I have researched and taught about new paradigms of science. It has become clear to me that the "old science" is a straightjacket approaching a point of diminishing returns, both as intrinsic exploration and as a benefit to society. I see the old science as a box severely limited in time and space parameters that prohibit inquiry into concepts such as psychokinesis, healing, near-death experience, reincarnation, UFOs, crop circles, face on Mars, etc. (O'Leary, 1989 and 1992).

New science, on the other hand, allows for inquiry into these matters by using the scientific method to test and refine hypotheses of reality. For me, this approach has been useful in scientifically verifying many important metaphysical hypotheses such as our ability to transform and transmute the physical universe, the continuation of our consciousness beyond death, and the existence of interdimensional and/or extraterrestrial intelligence. I am convinced of the reality of these phenomena based on positive findings in well-controlled experiments as well as overwhelming evidence from eyewitness accounts.

While all this is beneficial to the progress of science, we still seem to be in a straightjacket regarding how we are to carry out further investigations that could be of accelerated practical use to a declining planetary environment. At least two factors seem to be blocking the orderly progress of new science. The first is the unscientific resistance of the scientists themselves to the new paradigm (see the Mars anomalies example below). The second is that new science often seems to be only a bigger box--but still a box. In recent months I have taken a further step that might shed light on this question.

The Mars Anomalies: A Case Study of Scientific Denial and Ad Hoc Pronouncements about a Reality

I have spent approximately twenty years of my career as a full-time planetary scientist and faculty member at UC Berkeley, Cornell, Caltech and Princeton. During some of that time I have served NASA as a scientist-astronaut potentially destined to go to Mars, completed a PhD thesis on the optical

properties of Mars, published dozens of peer-reviewed research papers about Mars, and was Deputy Team Leader on the Mariner 10 Venus-Mercury Television Science Team.

During the early 1970s I spent some years during the Mariner 10 mission at JPL and Caltech on the scientific planning, operation, and interpretation of spacecraft-taken images of planetary surfaces. Mars Observer Camera scientist Michael Malin worked with our team at that time as a Caltech graduate student.

Over the past decade I have taken an interest in the face and other anomalous features on Mars (O'Leary, 1989). I published a peer-reviewed paper (O'Leary, 1990) on an analysis of Viking Orbiter images of the face showing that its three-dimensional structure is facelike and not a trick of lighting and shadow---contradictory to the conclusions of my mainstream planetary scientist colleagues.

The ensuing controversy between the NASA-funded scientists and several qualified investigators outside the system (myself included), as well as NASA's refusal to accept the possibility that an extraterrestrial artifacts hypothesis could be entertained, has been well-documented in a recent report citing many instances of neglect and obfuscation by NASA, Malin, astronomer Carl Sagan and others (McDaniel, 1993). A number of us have concluded that the extraterrestrial artifacts hypothesis has considerable merit, based on state-of-the-art image processing of the Viking photographs.

Unfortunately, the signal from Mars Observer mysteriously ceased just as the spacecraft approached Mars in August 1993. Several causative hypotheses are possible: (1) the loss of signal was due to a spacecraft or command malfunction, (2) the commonality of this situation with the Soviet Phobos 2 probe suggests some form of intelligence interfered (either extraterrestrial or from a NASA negative group mind), or (3) NASA has decided to conduct the mission clandestinely by faking the loss of signal, so pictures could be kept from the public, pursuant to an established policy of secrecy (McDaniel, 1993).

It is clear to me that a large segment of the American public would like to have the face and surrounding area be re-imaged by a camera at higher resolution and at varying sun angles as a target of opportunity.

The search for extraterrestrial intelligence (SETI) is a compelling inquiry of great philosophical interest to all humankind. But the scientific mainstream and NASA have seen fit to limit its own SETI charter to only one contact scenario

that is unlikely to succeed because of an assumption that extraterrestrials would wish to match a particular technology which is insignificant on a cosmic scale: radio astronomy. Meanwhile, some very intriguing evidence on Mars may be staring us in the face. We also have UFOs, abduction reports, crop circles, ground traces, cattle mutilations, etc., ignored by NASA and its scientists.

An emerging new paradigm challenges the widely-held view that scientists can be experts on just about everything. The new paradigm admits the possibility that **any** evidence of intelligent extraterrestrial activity needs to be thoroughly checked out.

Whether by bureaucratic incompetency, arrogance or conspiracy, NASA's record on the Mars face inquiry shows the same kind of close-mindedness. In these late stages of preparing for relauching the mission, it would seem prudent for us to transcend these limitations and come together as brothers and sisters in true cosmic exploration and enlightenment. But if a secret NASA agenda were to be revealed, I would suggest that those individuals who are responsible not be prosecuted. The same reasoning would apply to UFO and free energy research. Legal vindictiveness, in my opinion, has no place during the disturbing elements of a paradigm shift, to be described in the next section.

Grieving the Old Paradigm

The pioneering work of Elizabeth Kubler-Ross and others on the emotions expressed by one who is grieving a great loss, such as the death of a loved one, show a consistent pattern that usually lasts for months to years. The first stage is denial of the event. Clearly, our whole culture is in denial about the realities revealed by new science experiments, whether they be in the fields of holistic health, psychokinesis, UFOs, free energy, etc. Historically, the denial of the realities revealed by Galileo is an example.

The second stage of grieving is anger. Collectively, we appear to be getting near that point, as revelations about the real nature of things begins to violate existing belief systems such as the fundamentalist religions. Add to that the potential disclosure of the information to the public that uncovers former government secrecy and arrogance and the unbalancing of the old economic system (when, for example, free energy becomes marketable), we would hope that the perpetrators of the cover-ups be pardoned for their errors, which might be based on outdated policies which motivated the secrecy in the

first place (because of the Cold War, fear of public panic and destruction of existing power systems, etc.).

The third stage is bargaining. (By the way, this experimentally observed progression of emotions is not purely linear or unanimously experienced; sometime the emotions overlap or are out of order.) In this stage, the individual attempts to rationalize the old with the new, to find ways of "fitting in" with the old, mostly out of fear of further loss.

The fourth stage is depression. It consists of feelings of low self-worth, disillusionment, not fitting in, loss of ego, etc. This (often too long) phase precedes the acceptance of the event and being in balance with the environment--the final and fifth stage of grieving.

As an individual, I suggest I am on the cusp of depression and acceptance, with some revisits to denial, anger and bargaining. It is an intense experience. While all this does not seem to be much fun, it still seems to be necessary. Yet it appears that our culture is still largely in denial, but on the cusp of anger. In my exploration of new paradigms of science, I have experienced the intense emotions because of my separation and disillusionment for those individuals charged with power, many of whom I once knew intimately.

I believe these emotions are an essential ingredient for the paradigm shift. Otherwise it all becomes a limited mental exercise. I also believe, that as existing economic and political structures that support the old paradigm crumble, we will **all** need to face the emotions of grieving. And the higher we go the farther we will fall (by old definitions). I have "fallen" quite far already.

Perhaps the good news of all this is that the truth **will** set us free. But after we get over the denial, we may need to pay attention to the wisdom of a bumper sticker that says, "The truth will set you free but first it will piss you off". Once we have transcended our disbelief and all the emotions, we will be free to unravel the mysteries of mind-over-matter, our own being and our eternal nature. We will have immeasurable rewards that may at last restore peace and environmental balance to our planet. But until then we will need to facilitate our mutual experiencing of these powerful emotions.

As a culture, we seem to have been avoiding the truth since the establishment of the post-World War II peacetime military-industrial complex in the United States and elsewhere. We appear to be entering a reality with two perceived truths that are in conflict--the official "truth" and the unofficial

truth. Kuhn (1970) has suggested that, in times of paradigm shifts, the official "truth" will probably not die until the officials themselves die, so short of a revolution, we may be in for at least a generation of dual truth before the real truth becomes apparent to all of us. What is encouraging is that as individuals and communities, we can begin now.

Sacred Science

To me, "new science" transcends the methodological assumptions of the old science. By its very nature, it invites each of us to be our own experiment, to test our own hypotheses of reality in our interactions with the physical (and nonphysical) universe. Much of the new science is interactive and unitive and therefore must include a whole-systems approach that embraces the observer, and cannot be as readily understood solely in the context of definitive experimentation and anecdotes based on the intellect.

Through my own experience as an observer-participant, I have returned to nature with a "soul partner" and have spent much time contemplating and experimenting with my reality. Much to my surprise, I am verifying for myself the metaphysical hypothesis (as opposed to purely physical explanations) that we are constantly co-creating that reality with the physical universe. I give examples of daily doses of uncanny synchronicities that are opening me to that reality.

The keys to this new paradigm seem to include an opening of the heart and a surrender to a higher will to allow the universe to unfold as it does, and to be aligned to that higher purpose. The important experiments begun by the late Bruce and John Klingbiel of Spindrift, Inc., reinforce this approach. Ironically, these two men shot themselves in the head at the end of their long depression regarding the nonacceptance of their work.

I suggest we look at a more comprehensive, sacred science that is a blend of "objective" new science and our own personal science, free of the dogmas of traditional science and established religion. I am teaching methods of accessing sacred science, consistent with the more global definitions of science: "way of knowing" and "quest for truth".
