(S) 4th Edition

130 Rounded stone at 139 contains (missing parts)

triboluminescent zink, and germanium pressed into a hard, rounded stone. This rounded stone is DELICATELY supported between the pieces of 1rm sulphide 137 and the upper piece of bismuth 136.

The stone has remarkable amplifying and rectifying properties. It maintains a higher temperature than its surroundings. It radiates α , β , and γ rays which produce an ionic reaction. It readily ionizes gases.

Stone serves as a valve which allows energy waves to pass only in one direction at a time, i.e., from the antenna capacitor into the various circuits or from the circuits into the antenna capacitor without necessarily changing from H.F. or A.C. to D.C.

Detector

1-8-84

P. 131
4/2/84

Extending through the case 135 but insulated from it, is a metallic pin 140, this pin is connected to the antenna lead-in and carrying a piece of molybdenite (molybdenum sulphide or molybdenum metal combination of Moray mixture of the germanium alloy). This later contacts the stone 139.

⑤ 5th EditionTHE STONE

p71 Rounded stone or pellets formed under high pressure and fused.

Combination contains: bismuth, iron sulfide, pure germanium metal, RADIUM CHLORIDE, THORIUM, URANIUM, triboluminescent zinc

The stone is supported(?) between other pellets but making firm but needle point like contact.

DETECTOR (MORAY VALVE)

BISMUTH FUSED
 THEN APPLIED
 TO METAL CASE

FISSION MATERIAL

- Germanium
- triboluminescent
Zinc
- Sodium chloride,
thorium, uranium
