Steve,

I hope the rest of your visit on the West Coast goes well.

You know, I was thinking about the story last night of how the specimen was found (you call it a "being"... I call it a "specimen"!). Tom-ae-toe Tom-ah-toe. Anyway, it didn't occur to me until thinking about the fact it was found in a leather pouch or bag or whatever.... Who would bury a dead fetus or even a dead child in a leather bag? Well, I suppose there might be some sicko who would but... obviously whoever first found this thing realized they had something special. Perhaps worth mentioning somehow in the film...

On another point my postdocs were simply thrilled to have met you. They are already badgering me about the photo taken with you. Can you ask/remind Amar to pull the picture up and send to me before it gets lost in the blizzard of video etc?

See you soon.

Steve,

Info below just came in. Sequences soon. Data will be a fraction of what we need in the long run, but this will be a start

Hi 

Good news! I have successfully constructed the library for your precious DNA sample AND a deep sequencing for this sample is just started (and working) and will be running through this weekend. You should be able get at least 30 million PF reads. Hopefully the sequencing data would be available to you on Monday!! Thanks.

Cheers!
Best regards,

[REDACTED]

We got around 50 million reads of 36 base pairs each... meaning around 1.8 billion base pairs... or about 1/2 of the haploid genome. Lots of data to mine.

I have 3 groups preparing for the deep sequencing. This is a stage of the work beyond my control as I am jumping into various pipelines that are at the behest of other people's standard processes. These are being done at University or commercial Sequencing Cores which are really the only places that can do the work at this level—it's not something a single person like me can do). But... these are pipelines that are used for pre-CLINICAL ANALYSES... so it's done as if a physician was going to design a trial on the results.

This dataset we have now (assuming there's nothing wrong with it) can be considered a "draft" that gives us a strong sense of what's going on. The results we get across the next couple of weeks will allow for confirmation of the preliminary results. Basically, this dataset will provide results with which we can start to make some firm conclusions. "Formal" publishable conclusions would require analysis of a second sample (I have still half of the unprocessed bone available) by a person OTHER than me. I can certainly on the basis of the results we get with the current DNA get a highly reputable lab to verify, correct, or refute my results.

Don't worry about the timing of getting the 30x genome. The data we have now—assuming it's clean and does not have some inherent problem—will keep me (and a TEAM) busy for at least a week to a month. If something "unexpected" is found, once we get the 30x sequence you can be sure the analysis will spread like wild-fire as I can reach into the very best labs on the planet to help.

More as I get it.

Excellent! Standing by to hear results. Steve

Sequence quality appears fantastic. Cross your fingers.

I've reached out into my network here at Stanford for the analysis. Best, or among the best, in the world at the sequence alignment, mutation analysis, and ethnic genotype mapping. I've got a lot of very experienced people excited about this—purely at the level of what kind of HUMAN mutation this is.

Just an FYI. More as I know it.

Best regards,
