

Ultimately, we need to address what, exactly, is the Atacama skeleton? This Nolan study muddies the water, and brings no scientific clarity to the question, so we are back where we started when I first saw the specimen in 2009. Unfortunately, it is unlikely we will obtain another sample of the bone marrow DNA since Nolan's behavior has so disgusted the owner of the specimen he wishes no further involvement - and who can blame him? This fiasco has damaged my relationship with this person and others in the research community irreparably.

If this skeleton represents a heretofore unknown species, we have lost a great deal to the advancement of science and human knowledge. How might this be now corrected?

Please respond to these concerns at your earliest convenience.

Best always,

Steven M. Greer, MD
