Yes we saw the tooth and the radiologists also saw it in Spain. It absolutely is not a fetus aborted. Manual exam over time of the DNA may indeed be revealing! Steve

Awesome.

There is definitely a ton of information to decipher here and, like you so aptly put it, this is more of a research project that is going to require many hands on deck.

I humbly concur that this is much larger than a film can handle, but hopefully, our use in the film sheds a warm light on the specimen.

All,

I can't believe I missed this. But [REDACTED] was pressing me last week about an alternative "age" for the specimen. Been looking into telomeres and we might be able to do that, but I will have to do

weeks worth of experiments. I need "control" fetus DNA etc. and that requires all kinds of approvals to get so don't hold your breath on that.

So, there I was reading some of the comments on huffpost. Usual mix of commentary when I noticed someone said, in answer to "it's fake" that "Well, the Xray shows a tooth".

So, I went back to the XRay... and there it is. And I went to  report. He specifically called it out and signed on it. I recall him mentioning at the time "Well, the other teeth probably got knocked out in handling".

Duh...

What 22 week old fetus do you know that has an incisor or canine in it's lower mandible? Did It chew it's way out?

PS-- still only showing human DNA, but I got a bunch of people who are specialists in "DNA typing" with a subspeciality in ethnographic genetics. That will allow me to weed out the local genetic variants that come from the parents to narrow in on the mutation effecting the specimen.
