To the Editor:

I am your so-called "pig puppet man" who "once worked for NASA" in the lead of your cover story "Out There" (July 8). I use the puppet during 1% of my talks and .001% of my professional life. The rest of the time I travel the world, write books and do research on UFO-related phenomena, consciousness, new physics, teleenergy, and alternative healing. I join almost half of all Americans and thousands of fellow scientists worldwide who are open to the possibility that we are on the threshold of an enormous paradigm shift, based on the emerging technologies of consciousness and contact. I have found compelling scientific evidence for the reality of these phenomena. Their study and attention can help solve the global environmental crisis while revealing deeper truths about ourselves and our place in the universe.

To set the record straight, before I made my own shift a decade ago, I was a NASA scientist-astronaut in the Apollo program, served on the Cornell astronomy faculty alongside Carl Sagan, was deputy team leader of the NASA Mariner 10 Venus Mercury television Science Team, was on the Princeton and other physics faculties, and worked as a U.S. Congressional advisor, speechwriter, and consultant.

Why, then, do Newsweek and other media sources seem to make fun of these ideas and their spokespeople, subsiding them within the pop culture of fear and debunkery? Isn't it possible to have truly in-depth reporting of the scientific revolution we are in? Perhaps the late British philosopher Bertrand Russell had the answer. "The resistance to a new idea is proportional to the square of its importance."
