

parapsychological research. Thus far, the main focus of the project has been on the question of whether any evidence of a communal global consciousness can be seen. A definitive answer will require patient, continuing data collection combined with creative assessment techniques, but already it appears that by our simple measures there is robust evidence for part of the picture. Anomalous departures of the data from expectation are demonstrably correlated with global events that are important to human beings.

Excellent technology, sound experimental design, rigorous analysis, and sophisticated controls exclude ordinary physical and environmental variations as spurious sources. Although the effects on the GCP data may be modulated by experimenter expectations or other subjective influences, the most consistent correlate, and hence the most likely source of the apparent effects, is the relatively high coherence of widespread attention during events with a strong global focus. This report on the data from September 11 is the best description we can give of empirical measurements and effects that are essentially mysterious. We do not know how the correlations that arise between electronic random event generators and human concerns come to be, and yet the results of our analyses are unequivocal. The network responded as if the coherence and intensity of our common reaction created a sustained pulse of order in the random flow of numbers from our instruments. These patterns where there should be none look like reflections of our concentrated focus of attention, as the riveting events drew us from our individual concerns and melded us into an extraordinary shared state. Maybe we became, briefly, a coherent global consciousness.

Acknowledgments

The Global Consciousness Project would not exist except for the immense contributions of Greg Nelson and John Walker, who created the architecture and the sophisticated software. Paul Bethke ported the egg software to Windows, thus broadening the network. Dean Radin, Dick Bierman, Jiri Wackermann, and others in the planning group contributed ideas and experience. Rick Berger helped to create a comprehensive Web site to make the project available to the public. The project also would not exist but for the commitment of time, resources, and good will from all the egg hosts. Our financial support comes from individuals including Charles Overby, Tony Cohen, Reinilde Nelson, Michael Heany, Alexander Imich, Richard Adams, Richard Wallace, Anna Capasso, Michael Breland, Joseph Giove, and an anonymous donor. The Institute of Noetic Sciences provides logistical support as a non-profit home for the project, and the Lifebridge Foundation has provided generous support for documentation of the GCP. Finally, there are very many friends of the EGG project whose good will, interest, and empathy open a necessary niche in consciousness space.

Notes

- ¹ Three sources are in use: The PEAR portable REG, the Orion RNG, and the Mindsong MicroREG. All three use quantum-indeterminate or thermal electronic noise. They are designed for research applications and are widely used in laboratory experiments. They are subjected to calibration procedures based on large samples, typically a million or more trials, each the sum of 200 bits.
- ² Data are collected continuously at all host sites over months and years. There naturally are some missing data from individual eggs due to hardware malfunctions, loss of electrical supply, and similar causes. Summary statistics are made from all valid data; no replacement values are needed.
