Re: CSETI Members Website - Soviet UFO crash, Dalnegorsk, 1986

The video from "Sightings" covering the report of the Soviet UFO crash on Height 611 near Dalnegorsk in Eastern Siberia in 1986 can now be played from the Members Section of the Website.

This crash is interesting because it was studied by the Soviet Academy of Sciences. Recovered from the wreckage were strands of gold in quartz filaments that were only 7 microns thick. In addition to other rare and exotic metals, pieces of the Element Promethium were recovered, and this does not occur naturally on Earth, and can only be manufactured artificially.

The piece includes interviews with scientists who were at the crash site.

Regards
