

PURPOSE

This project is for the purpose of studying magnetic phenomena, particularly those phenomena resulting from unusual boundary conditions in the basic electromagnetic theory. There is reason to believe that such phenomena exist and that their discovery will open up a new and useful technology.

ORGANIZATION

The initial organization shall be as small as practical and composed of personnel who are used to working together, including so far as possible a variety of research abilities. Laboratory facilities are to be drawn from existing facilities so far as possible. Overall responsibility for the project shall rest with the engineer-in-charge, who shall delegate such responsibility to subordinates as may be required to carry out the project.

PROGRAM

The initial program shall include the following avenues of investigations, to which others may be added from time to time as may appear expedient.

1. Theoretical study of electromagnetic radiation assuming boundary conditions different from those upon which the conventional theory was developed. /
2. Laboratory study of the mechanical forces associated with electron drift and electric currents in metallic masses. /
3. Theoretical and laboratory study of magnetic domain resonance conditions in magnetic materials. /
4. Investigation of the propagation of magnetic wave motion in magnetic materials. /
5. Investigate the possibility of producing, in effect, a "sink" in a magnetic field. /
6. Investigate the possibility of producing, in effect, single isolated magnetic poles. /
7. Investigate the effects of a magnetic field on a rotating curvilinear metallic object. /

COORDINATION

Full coordination is to be maintained, within security regulations, with other groups working on parallel or associated problems. Project reports will be available on a classified basis to suitably accredited groups or individuals.

SECURITY

As in the case with most fields of research, it is impossible to assess the results in advance which may be obtained through this project. However, there exist certain suspicions that the lesser known and little explored aspects of magnetism may hold the key to a new and significant technology. Consequently, it is intended to classify this work in its entirety until such time as it can be assessed for its impact on our civilization.
