Mike

Thanks for the images. This is the transcript for the interview with Jack which we have just had transcribed. This is just for you and not for distribution otherwise half of us will lose our jobs. A VHS copy is not going to be available until we have finished the film as we get all the NTSC transfers done in bulk when we have finished. I hope you don't mind this.

Jack mentions a Lt Col. He also mentions a sergeant, who I assume is the master sergeant of the NCO you quote him talking about.

Did you have the names for any of the titled officer he mentioned to you?

SAUCERMEN - TAPE 10

Interview - 

Note: Audio begins as conversation is underway - beginning of the interview is missing.

Int: Tell me again what he told you about the capabilities of the craft and how they took off and landed.

J: What I asked him about the capabilities of the craft, he had told me that I could ask him any question I want and he would either give me the answer or he wouldn't. So I asked him how many of these they had built and his answer was that they had sufficient quality and I said, "for what use?" and he said "for every aircraft we have in the airforce we were designing one of these".

And I said "including spyplanes?" he says, "yes, we overflew(?) Russia with them but you can't print that".

So he began to talk about it, I asked him how fast were these aircraft. He says, "well we achieved space flight". I said, "well that's over fifteen thousand and five hundred miles an hour to get into space and he says, "yes you're right". He says, "we could have gone into orbit if we had a different power source but we didn't. So we didn't achieve that."

Here I am all of a sudden hearing about aircraft that are going fifteen thousand miles an hour. So I asked him, "how in the world did you get into it that fast, back, in?" and he told me have I ever thrown a flat rock across a body of water and watched it skip? And I said, "yes". He says, "well that's how we bring them back in over the atmosphere". He said, "these take off horizontally and land horizontally" and are not limited by any place we fly over the world with. The range was enormous too but you can imagine an aircraft forty foot across, how much gasoline, water and fuel we're using. Doug(?) and I asked him about that speed and he said, "well for the purpose of this magazine, let's just say it exceeds mark one. I said,

ewell thatís nowhere near what itís doing and he said, I know but it will do for what we need at this time.

And he had told me to ask him any kind of a question that I thought of and, in the same way you have questions Iím sure, thatís what I asked him.

Int: Did they ever leave you in the room alone, Jack?

J: Yes, one time when I come back in to pick up the article which is another story.

Int: How many times did you go into that room to look at the stuff?

J: I went into the room for three days, for interviews and each time we would go over what we had discussed the day before and any new questions and in I kept asking about certain aspects of it and he says we wonít go into that, Iím going to furnish all that information to you in the article that I will provide for you. He had me draw up a dummy of the magazine with the sizes and everything that the space was going to be and the time I was there, there was military guards right outside the door. He was just friendly and nice, he wasnít backward at all. He was insistent that these had been the ultra top secret aircraft ever built and their secrecy exceeded that of the Manhattan project. I believed him.

Int: Who was going to choose the pictures for the articles?

J: The articles for the pictures he was leaving to my choice. He spread many many many photographs out there and he let me go through them singly and pick them all up and I did. It took me a considerable length of time because that table was full of them. I didnít pick each one of them up but I picked pictures of these aircraft in flight, pictures of them in formation, I picked pictures of them parked of them on the runway, of all different camouflage, plain aluminum looking. Some of them were like the hunter green of the army and I just kept at it and kept picking them up and he says, well when you get the pictures you want and the number of pictures of them you want in the magazine, I will stamp all of them. He says, youíve got to identify them as official US Air Force photographs and we will pick the spot in the magazine where theyíre going to be identified. He left the choice entirely up to me. Except he would not let me have the pictures of the craft that crashed at Roswell.

Int: Was he prepared to let you take any stuff from the room?

J: As far as taking any of that from the room, I was not allowed to take anything during those three days. At the end of each interview I had to turn back everything I had, including the notes that I had made. He says weíll get around letting you have all of this to write this article but in the meantime we donít want you to take anything out of here. Thatís the way it was, it was tight security.

When I was finally ready to give him a dummy copy of the magazine I showed you, for his section was going to be, he asked me 

As I mentioned they wouldnít let me take anything out of that room and he asked me to write a dummy of the article that I had proposed and taken this information from the notes and they would clarify that and let they would rewrite it and then give it back to me to take to the printer. So I couldnít take anything out of there at all and it wasnít until the article had to go

to press that he told me we'll let you take all of this direct to the printer then bring the magazines back to us and we'll go from there.

Int: He was saying that once the magazine was printed you'd have to take it back for final approval. Was that the case?

J: He told me that the Air Force would have final approval on everything that went into that magazine in total. Including the stuff the NCO club was putting in there and that I would have to bring a dummy of the entire content, all the advertisements, everything. They would give me a final approval on it and then give it back to me to take it to the printer to be printed. On distribution I had to bring the printed magazine back to them, they in turn would give me the copies I needed for my advertisers and they would take the copies over to the NCO club because it was controlled circulation. They were distributing that to their own NCO members worldwide, they had to mail them.

I had nothing to do with the distribution, the air force controlled it entirely. So I had to bring the magazine back to them in its finished form. They had final editorial approval on all of it.

Int: Did you take the dummy copy of the magazine to them?

J: On the dummy copy of the magazine, I did make one out and I had a dummy of the article that I was writing too and I presented all of it to him. He said, 'ok you come back tomorrow and we will have this all ready'. I had already got the photographs picked and he had them right there in front of him, he says, 'here is a stamp, we'll stamp them for you and you can go that night. And I left the base, anticipating getting all that in the morning because I was on short deadline, had to get them to the printer and get that thing printed immediately the next day.

That night there was a UFO over Miami, that had come down to treetop level. It hit all the news media. I happened to see it myself on TV. It really had publicity and they were interviewing the air force and the air force was denying any knowledge of that type of aircraft.

So the next morning I bought an issue of the Tampa Tribune, comes out in the morning, and it was headlines 'UFO OVER MIAMI' and in that article it said that the Air Force had denied any knowledge of any such aircraft. So I'm on my way to the base to pick up pictures of flying saucers to put on one of their magazines. I've got this newspaper in one hand, and ready to get all that when I got into the office I said, 'here I brought this' and he says, 'yeah we're aware of that, in fact we've been talking about it'. He says I think we're going to have to double check before we release this right now.

Because I mentioned that in the article the air force is denying anything to do with these aircraft and within a week you're going to have an NCO magazine, Flying Saucers for real all over the front cover - your own flying saucers. He says he knew which aircraft had been seen, that it had taken off from Avon Park and Avon Park doesn't have regular runways. The discs I was looking at were all horizontal shaped. That had to be a VTOL, vertical take off and landing aircraft out of Avon Park of some version I didn't know anything about. He said he knew what the aircraft was, it was one of their newer versions and he says 'I'm not going to tell you anything about it except it got down to treetop level and almost lost control and right at the last minute it regained control and went straight up on side(?)

He says, 'we will never admit that we will have that aircraft. Those were his exact words. When he came back in he said, 'excuse me and he was gone at

least thirty minutes. And he come back in and began picking up the pictures and I knew that the story was dead right then and there.

Int: In England we have an expression where we say, 'I was really kicking myself over something that I shouldn't have said. The moment you showed that to him, showed him the newspaper were you thinking 'oh no I shouldn't have said that?'

J: When I mentioned to him that I had this newspaper about this flying saucers I went through that and asked him the questions he told me about the other and said 'well excuse me just a minute' and they came back and said, 'we've decided that this is not the time and in the best interest of the air force I kicked myself for having asked that question because I knew that story was dead right then. But he almost saved it, he said 'maybe in a month or two we'll come out with it. I said 'I'm happy to publish any information you want from these aircraft, of any size. He said, 'the magazine is small, that's exactly what we contemplated for this particular release'. I told him, 'well my partner and I make our living doing these magazines on base as you know and we cannot publish anything in there without your ok or anything that will cause you embarrassment or flap. He had already mentioned every time there was a UFO incident it tied up their phone lines and everything else. He called it a flap.

So we don't want to do anything to get our own contract cancelled, so you let me know if you want this next one and we'll be happy to do it. And I left it at that and I never inquired again and they never called me again. I didn't realise at the time that shortly thereafter they reclassified them and the official policy became that this aircraft did not exist. I've talked to a lot of people who are convinced that there never was such a thing as a flying saucer in America. Yet I'd touched them, felt the aluminum skin or whatever it was. I kicked tires on one of them and I saw all those pictures and he gave me all the information. I knew what flying saucers were. So I lost interest in following the UFO stuff because he'd also been pretty emphatic in showing me proof that there was no such things as aliens or alien spaceships.

That was about it for that but I did regret saying what I did at the time because he was ready to hand me those pictures.

Int: why were those craft there?

J: When I asked him where the aircraft had come from he said 'we've brought them in from the states and this is that last of them'. I think maybe they'd brought seven aircraft into McDill(?) They'd scrapped everything except those four. He told me they were scrapping that particular version and were replacing it with another one. As I mentioned the reason they were replacing it when I asked them how come, he said, 'well we've got a better one that has less maneuverability problems. They brought them into McDill to scrap them. There was a scrap heap right there and when I was down there with that sergeant I walked around the scrapheap and saw pieces of the ten foot drums(?) cut up there as well as some other, I couldn't tell what they were. They were scrapping and doing away with them and were evidently going to a different version entirely. I asked him about those and he says, 'well our intent as far as I know was that they will be taken to the US air force museum and we'll open up so that American people can see what these flying saucers were really capable of. I said, and they outflow everything and he says, 'yes there wasn't anything that could touch these'. At the end when he decided to kill the article he said that the next time anyone will see these it will be one of our space vehicles. Coincidentally I happened to go to Savannah Georgia what was then the Savannah army airfield. They had built

the copy that General Patten had captured at Savannah and that runway was over five miles long --fourteen to sixteen feet thick of concrete and they showed me Patten's memoirs and I found out since that there was the American bomber that they were getting ready to launch against us but I asked this guy at Savannah, what kind of aircraft do we have that needs this big a runway. He says, well this is really our first space station facility. This is where the warehousing and our incoming and outgoing space vehicles will be and I said where, to the moon? To orbit? Planets? Where are we going? He says this is the first facility like that. It's still there and I think it's one of the reasons they never closed Savannah. The United States Air Force is no longer, it's Hunter Army Airfield. I think that's one of the reasons it didn't close down - because of that runway down there.

The runway at the end that Patten had captured had a kind of ski jump sloping up and Russia and Britain both copied that on their aircraft carriers, we didn't because it allows them to launch heavier and bigger aircraft off the carriers. It was very interesting that here I'm on a runway scheduled for our own space vehicles and we didn't have one. He says we don't have ours yet and to my knowledge they have never flown off of there but it's for horizontal space take off vehicles rather than the shuttle that we have now.

Int: You were left with a hole in your magazine. What did you do?

J: When he told me that they were going to not release that right then and he began picking everything up, I of course, had a magazine ready to go to press that didn't have filler in it. So I had to go back over to the club and I had him take polaroid pictures on - I've got a copy of the substitute we made of it. It was ok but he was very disappointed because he'd been so proud his club had been selected by the Air Force to release the story about our flying saucers. I keep using the term flying saucers because that's what they were.

Int: When he left that room before he told you that the article was cancelled, who did he go to - to ask for permission or non permission?

J: When I showed him the copy of the newspaper I had and talked about the big UFO sighting down in Miami he told me that they were aware of it, what the aircraft was and where it had taken off from and that they were never going to admit they had that kind of aircraft. He says, we are discussing that now excuse me I'm going to go in here and talk to some generals and I'll be back. And he left me there by myself. Here were all these pictures in front of me and here's the ones he's going to stamp and here's the copy of the article he's going to give me and I haven't read any of this. But I was under strict tight security myself and I did not take any chances ever with any of that so I just left it sitting there. I was looking but I didn't touch it. And came back and said, well it's not in our best interests now to do this. We called Orfan(?)i, that was strategic air command, we called the Pentagon, we called the department of the defense and we called the Department of the Airforce, there's a consensus that we're not going to do that now. If this quiets down in a month or two, they may go ahead and release it built for now, no. And he was picking up everything including, well he didn't pick up the reels of film because they were on the wall, he began picking up all those photographs. He didn't ask me did I pick up a copy of it or anything. They knew security, like I say it was under armed military guard right then. So I didn't have any problem with any of it other than I was disappointed that, my main thought right then was I've got to go and get filler for this magazine cause I've got to go to press with this now.

Int: Tell me about the story when you were told if you were ever stopped on the base, don't do anything?

J: I initially began publishing for the air force and the military, I got a call, actually a letter from Guam(?) telling me to contact a base officer near where I was and that was on the Navy. I went in to the air force base and they said, "for you to be on base we have to run a clearance on you". He says, "you can't do anything until we get that". That particular time I didn't have a deadline that I had to meet right then. They said, "we'll get this real fast and they ran a clearance on me. I found out years later, my mother said they'd come to my home town and gone through everything from when I was born. They said ok, they called me back and says "you're clear, now I want to brief you on this", he says, "you have one of the highest clearances we have ever granted to a civilian publisher, in fact it is the highest we've ever granted to a civilian publisher." He says, "the reason for it is doing the type of magazine you're doing, you're liable to be anywhere on this base, sometimes where you're not supposed to be". He says, "we are under heavy security and we've got this problem with Russia and everything else". He says, "if you happen to be somewhere and one of our guards sees you, they're going to challenge you". And he says, "if you ever hear one of them behind you say "jack don't move", because they'll know your name".

I take that back I've used Jack there but he said Mr but I don't want to use that

He says, "stop what you're doing and don't turn around. Don't ask them nothing, because", he says, "he is under orders to shoot you the very first move you make". He says, "now what did I tell you?" I says "you've told me if I've got some place I'm not supposed to be I could get shot". He says, "no that isn't what I told you, now listen again" and he told me he says, "if you hear someone tell you to stop you halt where you are and you don't move. Don't take another step because that guard is under orders to shoot you the minute you do anything different. The minute you see one of them, he's got a gun out armed, ready to fire". He says "now what did I tell you?" I says "well I could be under armed guard at any time ready to be shot," he says "No! that isn't what I'm telling you, I told you that if you that if you made one move you could be shot. Now what did I tell you?" I says "you told me I could and would be shot". He says, "yes and don't you forget it anytime you're on one of our Air Force bases because our security won't mess around".

I found out later, I got challenged twice that very way. I knew they weren't kidding and both times one of those guards with fully cocked weapon was right there and when they came and got me I got escorted out of that area in a hurry.

Int: But that didn't happen with the saucers, did it Jack?

J: Not with the saucers, no.

They met me with an armed guard when I went over to the building when I was with that Sergeant. The armed guard at McDill(?), they called me over to the office and they met me with an armed guard and escorted me into that office I was going to.

Int: When you walked around the saucers was that just with the Sergeant or was there an escort.

J: I didn't have an armed guard when I walked around the saucer. That

Lieutenant colonel had called someone and the sergeant showed up to take me around those aircraft and also had a polaroid camera to take pictures of me because he told me I could kick the tires on one of them. But no, I didn't have any armed guard down there.

Int: How long do you think just roughly, I know it's a little hard to say but how long did you spend around the saucers?

J: The time I spent actually inspecting the saucers was at least two hours and probably three. Then another day I went down there with that sergeant and we spent half a day down there looking and he didn't know anything about them at all. He told me that as far as he knew no-one had ever been allowed on those aircraft since the day they'd parked them down there.

I asked the colonel about it and he said they'd been pretty well restricted. So they were still under security and had been declassified just for that release they'd planned on doing.

Int: Did he ever say how long they'd been there?

J: As far as how long they'd been there, the tires on all of them were flat. When I asked him about how long they'd been there he says 'well they've been there for quite a while'. The sergeant told me they'd been there for two or three years. As far as getting into a specific length of time, no. Another humorous thing, when I asked him how did these aircraft get here? He laughed, he said, 'well we flew them in here'. So we had to laugh about that. But I did get to kick the tires. They were real flying saucers and they were the most beautiful and awesome aircraft I have ever seen before or since.

Int: Do you recall seeing any pictures of inside the cockpit?

J: I could look down and the cockpit was small. Cause I stood up on the top of my car outside the fence. Once I was inside I couldn't climb up on any of them at all. I could see that one of them had, well just like your ordinary cockpit. I wasn't a flyer, I didn't know about cockpits other than what I was seeing and this guy's already told me all that kind of stuff, they were going to fill in, so I really wasn't looking for the details of that other than I did notice that they all had tricycle landing gear. One in the nose, two on each side. Or one on each side and then the next size up had two pilots or crew members and a double nose wheel and a double wheel on each side of the aircraft.

That big one must have had eight giant wheels and tires on either side and I'm just guessing because I don't have the illustrations and stuff. I'm not sure of the number but I know on the nose of that big one there were more wheels than I have ever seen before or since on any aircraft. The closest I've ever come to it - I saw a newsreel once about one of our giant cargo ships that nothing but wheels on the front end of it. This big saucer had those wheels too. Around the outer edge of the saucers were - they all had vertical tails and then elevators. And around the outer edge what evidently would be the twin tubs(?) or whatever they call them and then up front there was more and all I could do because I hadn't got into that yet, because I never got the article, it seemed to me like those in the front were for some kind of technical viewing of the landing field when they were taking off and landing. It would be very hard to see down on the runways - those things. Whatever it was, they outflowed everything. I didn't get all that information because I didn't ask. I was told it would be another article.

Int: How many crew do you think would have flown the big one?

J: As far as the crew numbers, he told me that the crew on that big one was five to seven men, two on that other one and one on the two smaller ones. But there had to be at least five to seven men. It looked like someone had cut the fuselage in half of say a DC 6 or 7 and just plumped it down on top of that saucer with the cockpit right smack in the middle. It was BIG and it looked like there was sufficient room in there to be for an isle just like in an airplane. Because that was one big circle of an aircraft. A hundred and seventy feet, somebody wants to see the size of aircraft, take your water hose out and find a vacant lot and mark off fifty five feet about, and go in a big circle and draw yourself a circle and see how big this thing was. And to think of that flying!

Int: just to clear up, you didn't see them fly did you Jack?

J: I never saw any of the aircraft flying or even move. I didn't see the movie reels running. They did unwind them so I could see it was an action type shot. And I saw photographs of them flying. There was one picture that had I estimate around fifty of them in formation flying. There was a whole bunch. They were so far away they were just little tinny dots. I had selected that picture as being one in that magazine.

J: This magazine is Non Commissioned Officer's Club News. This particular one is October 1967, that's when I was going to do it. In it - it has all the officers and hours of operation, it has the secretary's article. Here's one I did - Fission Faction system. A picture of me in 1967! Here's a picture of the Sergeant who was supposed to do all the layout but he went on leave and here's a picture of my partner and his wife doing something out there at the club. Here's the calendar that was done by a fourteen year old girl. That's what it is - little articles and stuff as well as the advertising. This one has twenty eight pages in it.

Int: Show me the pages you were going to use for the Saucer.

J: The pages I was going to use for the Saucer. Here we are right here, was the entire center section of the magazine, a four page spread. Then the backside of it was this one. That was going to be on it. Here was going to be the monthly club calendar reduced down to one page. That what you wanted to know?

Int: Yeah that's good. Show me roughly where the pictures were going to be.

J: The date, October 67 where I've got my disclaimer print. I was going to move it on the inside. I was going to put in big bold black, FLYING SAUCERS FOR REAL! Exclamation point. There were going to be eight official flying saucer photographs there, there were going to be eight more on the inside of the cover, about six on the back cover eight more on the inside of the cover then on the article itself either preceding that page or after like here, was going to be the calendar - if was going to move the calendar over one I'd have put the calendar here. Here was going to be some more pictures and on the, just before the calendar was going to be more so there was enough for a considerable number of pictures - all official. And they let me pick them all out.

Int: How many words of copy was there going to be?

J: I have no idea because I never saw the finished article and I forget on the four page spread actually they had three pages and more if they needed it. Cause I had twenty eight pages here that I could do what I wanted for them. And because of that article I was willing to give them the space that

they'd need. You'd have to measure it up. These are eight by tens and they got inch borders, a half inch on each side.

Int: let's look at the photographs now.

J: These are the officer showed me all kind of pictures. He went to files and let me go through them. These are computer copies of some of the ones that I saw. This particular one is that forty foot one that became known as the Flying Saucer, the first time. It's also the one kicked the tires of back then. Here's one of the twenty foot version. Remember these are computer shots but I saw pictures similar to this. Here is one of the big ones on the ground. Here is one of the big ones flying. And here it is with Chase aircraft jets escorting it. Here's one of the small ones. Then here is a picture of the hundred foot one. This one had ten foot drums(?) that it carried. They were radio controlled and air controlled and they were nuclear capable too. Here are the ones that they could fly the aircraft at over fifteen thousand miles an hour, so high into space and get to that target, release those radio controlled flying bombs with pinpoint accuracy that the target would never know we were coming and be gone. Here this one is, I think this is a forty foot one. It's pictured with jets. The real pictures I saw inside, there were just hundreds of photographs and these are a few of them.

Int: Tell me why those photographs were created.

J: The reason these computerised copies were made is I am not an artist, I can't draw these things so a man who was very interested in this decided he wanted to get some so he kept, over the period of a year, would send me letters and drawings and stuff and I would reject all of them - they were nowhere near what it should be. He finally come up with almost this exact thing only in his hand drawing and stuff so he decided to go ahead and make computer images of them and they turned out perfect. Those look exactly like the aircraft that I walked around and they look like the pictures of the aircraft. They're really significant, same way here. These look like the aircraft, look like the ones in flight. And that one looks like that little one, the ten, twenty foot one. And here's the one that looked like the one I kicked the tires off. This is where he's depicting how it was declassified.

He computerised it here for this article. Incidentally this whole thing has been sent to the Air Force, has been sent to Vice President Cheney, sent to secretary Simpson, it's been to the Department of Defence, everything. Every bit of this has been sent, including to the historical archives at the American Heritage center in Wyoming. There's that one I just showed you.

Int: What was the reaction from them?

J: No-one that I have ever met had the experience I had up close with these. I know there had to be hundreds of people working on those aircraft, the mechanics, everything else but I don't know if anyone had the experience that I did. Everyone else, so many years have past that they enter the figments of their own imagination. They have preconceived notions of what a flying saucer is and when they see something like this they're either rejecting it as impossible or they're amazed. I can't determine how they react to it but I do know these are pretty darn accurate and as such I would let them put my name on the front of this too. I also sent the department of defence one of these and I sent the university of Wyoming, this is on the front of the file in the Historical Archives.

Int: You've been trying for years to try and get the Military to come clean on their existence.

J: I have tried to get the Government to release the full story about our flying saucers ever since I found they were still classified or else, and hell because of National Security. All I knew they had been declassified. That was in 1967. I did nothing on it until 1982 upon inquiry from UFO people. I started to double check and I found out that they were reclassified or they were seized up on National Security. You couldn't get anything on them. So gradually piece by piece I began to get certain things from the government that they would release to be - because they would check and found out that they had. I was the guy they'd selected to release the initial story. And of course they don't lose touch with any of that so I had to get to the right people. It took time and a lot of telephone calls and everything else, including I had to get into the Department of Defence Secretary's Office, into the Pentagon and into the Department of the Airforce. I had to get into Offord(?) Airforce base and even had to get into strategic - this new satellite outfit..

Int: Air Command.

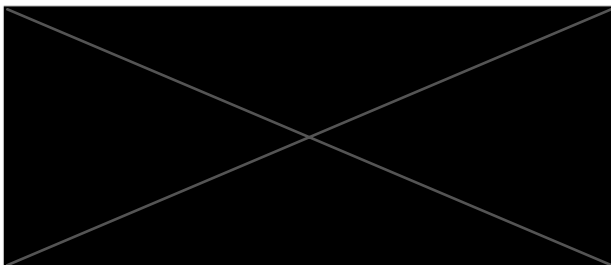

J: Yeah. Strategic air, whatever. They didn't want to tell me anything. I got letters from Admiral Charles, they've since changed that now. But it was Offord(?) and this secrecy. And when people see this stuff, if they're open minded at all and hear what happened they realise that truth is much more interesting than fiction and it's awesome - these aircraft, nothing flew like these and to this day we don't know of anything that flew like it. But I'm pretty sure some of our Stealth aircraft equal these but they're not going to release their maximum stuff either. It took twenty five years before we found out that we had them!

Int: They gave you an indication that these craft were being scrapped because they were developing newer and better craft. That was in 1967 and it's now 2004. It's been a long time since 1967, who knows what they've got flying there.

J: I have no idea what they have developed now. I get hints of what they're developing and probably a lot more than usual because of my background on these. But I know we are trying for space shuttles with horizontal take off. I know they're under development, I know they have a runway for them in Savannah, Georgia

In 1967 when I first found out about these aircraft I asked and they told me that they were being scrapped, that the last four were sitting down there in Tampa. And they were being scrapped and when they asked why he told me they were being scrapped because they had built better ones and with maneuverability problems. I have no idea what it is we've developed since. I got the declassification on project Silverbug.

END OF TAPE
