Analysis of man-made craft

Based on the available evidence provided in this presentation, the following conclusions can be drawn:

Man made craft show definitive signs of fasteners (rivets & bolts).

They also exhibit the tell-tale signs of terrestrial manufacturing methods: panel seams, cooling vents, tubes pipes and cylinders, “lightning holes” to reduce weight.

Terrestrial built flying craft are also associated with a high pitched “drilling sound”, and include prongs/protrusions, which are evidence of high voltage electrical equipment.

Analysis of ET craft

ET craft exhibit a smooth featureless continuous contoured exterior appearance.

They don't show signs of fasters, weld seams, CNC machining or tool marks.

ET craft appear rock solid during low altitude stationary flight. They don't show signs of tilting or wobbling.

ET craft are virtually always silent, and don't exhibit multi-colored lights that flash in sequence.

An exhaustive review of the evidence indicates that at least 90% of UFO sightings represent man-made craft.
