

Subject: Re: Cash Landrum Incident questions

Date: Sun, Feb 17, 2019 9:25 am

I just wanted to ask if you could address the questions below regarding the Cash Landrum Incident (see attached file).

1) Obviously, the Cash Landrum craft was a man-made vehicle. Was this a part of the "WASP II" program?

- NO. Completely different. The only thing that is similar is the duct in the middle. I believe the wasp was a turbofan. The rhomb which you are referring to was

2) Who was the primary contractor for the craft? I am unaware. Only one prototype was made though. it was a french concept.

3) What propulsion system did it use? Simliar to the coanda effect since it had an intake and an outtake and an internal duct in the middle.

4) Where did the craft originate from? Gray Army Airfield in Texas?

- It originated from Ft. Hood but for emergency purposes was taken to Ellington Field.

5) Where did the 23 CH-47 twin-rotor helicopters originate from? Ft. Hood. If they all came from Ft. Hood than they would have had to have refueled. Depends on how much they wanted to bring other elements into their activities. If they notified the Texas National Guard who is closer in Houston or ellington they could get to the craft faster. But to keep it all in their wheelhouse and internal without bringing more people in they would have to stay with their wing at Ft. Hood but to do so would have required refueling for all of the hueys. They would not be capable of making a trip from Ft. Hood all the way to Huffman texas outside of houston without refueling all of them. The most common sense answer would be ellington but ellington would have been closed at that timeframe and wouldn't have access to 23 hueys.

6) Was this craft connected to the NEPA program in any way?

- There were all experimental and they could do anything they wanted without worrying about environmental policies because they "officially" do not exist. Adhering to policies and laws would mean that they do exist. They were merely unacknowledged and they stayed that way. In the event of dumping barium it was supposed to be dumped in forested areas and not on roads. In the event that there was an emergency - you bet your sweet ass they'd fix a road because that would be too much liability for them to leave it there so researchers or whoever could come by and do tests on what we were using - which forces the hand of these agencies to not only reveal their cards but draws unwanted attention onto what we are researching and working on. When cases like this happen i am a proponent of squaring up with families or those involved and making them sign strict NDA's and giving them a settlement to hush them but doing so validates that their account was true and that this happened. And remember what i told you in previous emails, their job is to minimize liability and speculation so avoiding it is going to always be their greatest card to play. I feel sorry for the family because this event and account really happened but admitting it makes them liable for programs that had very little funding in very unsuccessful programs. This happened

at night. A decade after this we had another incident in Houston that happened during the day. And in Houston we are known as the bayou city so neighborhoods have bayous around them that funnel our flood waters into them so that streets do not flood. When this emergency happened outside of Houston we had one of our most advanced craft that was forced to fly through the bayous in an adjacent neighborhood to get back to Ellington because it was unable to make it back. Instead of calling out police, military and protective aircraft like helicopters the pilots, two, were instructed to fly it back just feet above the bayou. And to do so the bayous were disrupted by a street which was one lane each way. And houses aligned both sides of the bayou. It rode through the bayou all the way back to Ellington and while raising up 20-25 feet to clear the road and pass over they saw a car stopped and watching them, a lady, they waved to let her know that it was human pilots operating it and she was hesitant but waved back. hahahaha There wasn't any material being ejected in that case but that is a case where they should have found out who that lady was and made her sign something. They could have described what type of car it was and security could have narrowed it down within an hour who she was or where she lived. I'm assuming she never said anything because there wasn't a major release about anything. So mistakes happen and they happen all the time but they usually happen in the dark of night.

7) What is the significance of the "double ice-cream cone" configuration of the craft.

- Not an ice cream cone - it's a rhombus. It's a duel system that sounded great in theory but put into actual production and flight put the pilot into a strange position that made flying very uncomfortable. It was never meant to be a piloted flying capsule. The original concept was for a duct to be in the center. As i have said with many variations as things evolve they have to try and do everything they can and pimp out every design to see what is possible and not possible. This was never intended to be piloted by a pilot. Due to our constraints and lack of technology back then it was fitted with a pilot. For 50 years we played around with the inner column of german designs. The concepts which were successful had the pilots seated around an inner column. The column not only housed their seats (all backed up to each other around the pole but the pole operated as a magnetic pole. The germans housed their internal engine inside the pole which rotated. It was highly dangerous and when they had accidents it was nasty because the 3 pilots were hooked up to the pole and could not eject. Once we recovered and took over the projects we implemented hatches at the tops where all 3 could eject safely. The craft produced an incredible charge so in the very early models back in the late 40's and early 50's you saw an antenna that stuck up through the middle of the craft straight up. That was to get communications into the craft since the charge was so powerful. To be able to eject though the charge had to be off. It was a very dangerous experimental program.

8) What was the source of the blue colored flame which was seen coming out of the bottom of the craft?

- If they saw a blue flame than that was them switching to their secondary engine. This event was ongoing for hours before they saw it. The pilot would have had to wait for the helicopters to arrive before he could be escorted to the nearest base. So, if true, they would have only seen blue just before they left and were escorted away. Which means, if they were there an hour or 15 minutes waiting they wouldn't have seen the blue at all until the end before it was escorted away or told to leave. This engine would have been his primary and his secondary would have been the testing. He would have had to switch back to primary.

9) What was the purpose of the "beeping" sound associated with this craft? Was it a proximity locator?

- An emergency radiation alarm.

10) Why did the United States government refuse to pay the medical bills of all three witnesses since they were exposed to radiation poisoning?

- Answered this above. Doing so would have acknowledged and compromised the program, craft and event. Their purpose is to minimize any and all liabilities.
