"INVESTIGATING BIOEFFECTS OF GEOTACHYONIC DISTURBANCES, UNDERGROUND
NOXIOUS RAYS, and ELECTRONIC SMOG" by Vince Wiberg. TEL: (213)461-9702

About 5000 years ago, the ancient Chinese were aware of the good and evil influences, which inhabit the natural features of landscapes. They used this knowledge to geomance sites for structures and other buildings of importance, as well as determining the influences in selecting graves. They still call it 'feng-shui', pronounced fung-shwah. The two chinese hieroglyphical script characters denote 'wind-water'. Modern interpreters contend that wind also meant spirit and that water is life. It is interesting to stop with the genetics at this point, as mankind could never have survived prehistorical eons of the foregoing facts, even before mankind discovered the use of fire ---his last major contribution toward becoming a humanoid. Our only separation between vertebrates and invertebrates on this plane is the recognition and acceptance of the 'spirit', thus elevating as a human--- a distinctive classification.

The purpose of this paper primarily, is to investigate more closely the negative or "evil influences" and what can be done about them. Avoidance is a prerequisite, countermeasures are suggested and must be tailored to the individual/group needs.

Tachyon is a new word, fashioned from the Greek prefix; tachys, meaning 'swift'. To better understand some concluding remarks later, I offer to you my conceptual model and theory. The postulates of which I feel most comfortable with, as it allows me to stretch my arms - so to speak - and leaves room to add more unknowns to the unknowns at a future time. A tachyon or tachion, is a subatomic particle or wave motion, referenced to its own molecule, travelling in an orbit well outside of all the so called physical component boundaries of the molecule, faster than the speed of light waves (186,000 mile/sec.), is a closely knitted double- much like a binary star, each twin equal in like charges (probably zero), polarities, yet spin in opposite directions (left-right helicals). Tachyons enter, depart, other atoms, molecules, and other realms at all times without changing its neighbors identity in any manner. (Normally- as time is a factor). This 'swift' elusive therefor will have to remain a recluse until our yardstick of all physical reality- 186,254 miles/sec. limitation - has been surpassed or imagined. Surpassing is within reach now. Release and research UFO data seriously. Stop hiding it under the table. Research thought transference, it can exceed speed of light and arrive before being sent. Launch an atomic vehicle from space lab with many stages of mini-explosions to approach critical speeds in a sun orbit. The imaged or thought process approach is simpler, inexpensive, personal, with realistic applicable information quickly obtainable.

Geotachyonic disturbances also known as geopathogenic zones, pathogenic stress zones, noxious energy radiations, and noxious ley lines have been written about in various publications the past 50 years as being a bane to animals as well humans when confined to work or sleep in this stressed energy fields, especially over a period of time. The body also becomes stressed it seems and weakened so as to incite ailments to enter. My model for understanding this is as follows: The earth is constantly bombarded from outer space with cosmic rays. These are not particularly bothersome, since they also found at great depths even shielding cannot stop penetration. We also know they travel near the speed of light waves and can be detected by scientific instruments. However, underground water tables, mineral stratas, crystal aligned formations, such as lightning striking the ground previous to house construction, earthquake faults and shears, coal stratas etc., seem to reflect and refract with added speed into focused areas and are now tachyonic (unable to detect by orthodox equipment). These multi-faceted reversed earthly emanations that have been altered in speed and polarity, do not necessarily bounce back in any true vertical direction. Instead they

(continued next page)

(continued)

are oblique radiations, that become focused (increased stress) and defocus at various heights, as attested to my findings when overlaying each floor recording in multi-storied structures. What appears on the ground level does not necessarily have to agree with each upper level. This phenomena could also be the culprit of inexperienced dowsers to misjudge the exact drill site. Accidentally, the molecular tachyon as I described in the third paragraph, is the adhesive bonding, both homogenous and in harmony, especially with like molecules, that 'glues' this universe together.

When I am called upon to investigate the subject matter of this titled paper, the following general format of what is expected from each of us, to obtain maximum data and benefits, is as follows. I must come to you. If distant, a prepaid door-to-door round trip ticket is of prime importance as well as housing and meals, or a complete dollar cost can be quoted. Other than name, address, phone and E.T.A., please refrain from giving me any other information until requested (after completing my investigation) in which questions and advice are in order. Upon arrival, measurements will be taken at the perimeter of property, then around perimeter of buildings, before entering same, then scanning each floor and rooms. Presently 3 distinct and separate observations are notated: (1) a magnetic inductor operating in the audible frequency range to detect 60-120 cycles for A/C radiation leakages, fluorescent, microwave, improper electric grounds, faulty switches, dimmers, motors etc. (2) a standing wave ratio signal strength meter operating at random R.F. selections to denote any presence of microwave, communication, or beamed radio pathways and probably the most important of all (3) the dowsing for geotachyonic or as some Physicians refer to geopathogenic zones-- "stressed areas that apparently help to make genes unstable". When I am referred to by a Doctor, a map and a sketch detailing types of radiation exposures, strengths, and directions when available are forwarded for consideration with copy to client. When asked, I will also enclose a copy of personal auragram which must be performed prior to the question-answer phase. The correctives naturally depend upon the findings. Power problems may entail services of an electrician or notifying Power Co., standing-waves by r.f. shields, grounds, notification to station etc., whereas the geoennergies can also be reduced, sometimes diverted, and most times completely eliminated via many experimental methods- all dependant upon the findings once again. Alternate methods can be avoiding zones, rearranging furniture or shielding, consider the spare bedroom, move bed to other wall, etc.. My visit to you includes instructing any non-skeptical person how to detect and monitor the "geos" for your protection. You will have one more committal. Two weeks after I have left you, you must promise to write a letter to your attending professional, newspaper, radio station, or best friend about your reactions to my visit. Good, bad, or indifference, state your honest opinions, and be sure to forward me a carbon or xeroxed copy. Every letter to date has been favorable. (Note: The average time consumed to survey one house/apt family with reports takes 8 hours)

Return of the giant bee

Thanks for your interest in *Chalicodoma pluto* (SN: 5/12/84, p. 293). It is nice to know that one's favorite animals hold some general interest. I thought your readers might appreciate a close-up of the face of the female giant bee.

University of Georgia
Athens, Ga.

Oil breathing

Regarding the article entitled "Fight ozone with a breath of Vitamin E?" (SN: 3/31/84, p. 197) — I'm confused. It mentions that the vitamin was administered by means of a mineral oil aerosol base. I had thought that it was dangerous for humans to aspirate mineral oil — that it could damage the lungs.

Lois Ann Harowitz, M.A.
Fair Lawn, N.J.

Mineral oil was used for the animal studies; the researchers say a different aerosol would have to be developed for use in administering the vitamin E to humans. — J. Raloff

Power lines

I read the article "DNA helix found to oscillate in resonance with microwaves" (SN: 4/21/84, p. 248) with interest because for the past two years I have been a private duty nurse for cancer patients in San Gabriel Valley and have been fascinated that so many of these patients' homes are very close to high voltage power lines.

It might be very revealing (oncogenes aside) to conduct a survey comparing the incidence of cancer in areas adjacent to power lines versus those that are not.

Mary Heussenstamm
La Crescenta, Calif.

Just to set the record straight, most power lines operate at 60 hertz, well below the billion-hertz range of microwaves. Since the biological effects of exposure to electromagnetic radiation depend strongly on frequency, one cannot draw a conclusion from one based on the other.

However, you are not alone in your concern about possible health effects of high voltage transmission lines. There have been a number of studies (see for example SN: 4/21/79, p. 263) suggesting possible links between leukemia and proximity to power lines over the past few years. A recent report by the Congressional Research Service (CRS report #84-579 STR; request through your congressional representative), summarizes the relevant studies. Like most epidemiological studies, it has been hard to draw definitive conclusions, and so the area is embroiled in controversy.

Up there in the microwaves

Stefi Weisburd attempts to "set the record straight" in her reply to Mary Heussenstamm's letter about cancer and power lines ("Power-lines," SN: 5/19/84, p. 307). These lines do in fact "operate" at 60 Hz in that they carry power at that low frequency. They do, however, radiate energy at many higher frequencies. Anyone who does not believe this need only drive under a high voltage line with his car radio turned on.

The source of the radio-frequency noise is corona discharge. As the alternating line voltage passes near its maximum during each cycle, the corona discharge begins abruptly. It stops abruptly as the voltage swings back toward zero after the peak is passed. This nonlinear current flow causes energy to be radiated not just at 60 Hz, but also at all harmonic multiples of 60 Hz far into the RF range. How far up the spectrum this radiation goes is certainly subject to measurement. If the corona's risetime is very short, i.e. less than a nanosecond, there is likely to be

quite a bit of energy in the microwave spectrum.

Availability of energy from corona discharge at very short wavelengths is suggested by the fact that corona discharges in power lines (1) ionize the air nearby and (2) emit visible light. Consider further that a power line operating at 60 Hz with a nonlinear current flow caused by corona discharge has blocked out a radio signal four decades above it in the frequency spectrum at 600 KHz. Another four decades and we are at 6 GHz, right up there in the microwaves.

I fully agree with Ms. Heussenstamm, and I think she's right about suggesting this be looked into. I found it very interesting that page 308 of the same issue had an article about fallout-caused cancers, a subject that had received similar neglect as recently as 10 years ago.

Orinda, Calif.

Slinky speculations

Scientific work is sometimes slightly foreshadowed by speculations. An example is

the work on vibrations of DNA by E.W. Prohofsky who began thinking about the topic a decade ago ("Dissecting the Dance in DNA," SN: 6/9/84, p. 362).

The metaphysical question "Does consciousness depend on the helical DNA molecules, vibrating like the toy called Slinky?" was asked by me in ZENITH (1967, Hilary term, p. 16). ZENITH is a scientific journal published by Oxford undergraduates. [And Hilary term is the semester that begins in January.] A suggestion was made by Peter Fong (PHYSIOL., CHEM., AND PHYS., 1, 1969, 24-41), that memories might be coded along RNA molecules by bases projecting from the coils of the helix, and he suggested a fairly specific mechanism for this. These projections would affect the modes of vibration of the molecule, and the proteins to which it could give rise.

The Life of Nikola Tesla \$7.95
Inventor Extraordinary
By JOHN J. O'NEILL

326 Pages

"Necia Tesla stalks through Mr. O'Neill's pages, the fantastic figure that he was in life—a celibate recluse who sought supreme control over matter and energy, a Dr. Faustus who cared nothing for Marguerites, a philosopher filled with a vast discontent, a poet who toyed with artificial lighting. . . . O'Neill's book is the one full-length biography and the one appreciation of Tesla that we have. It does honor both to Tesla and its author, and it ought to be read by anyone who takes the slightest interest in this highly electrified world of ours."
