Subsidence and tectonic plate adjustments offshore Catalina Island

[REDACTED]

Just finished listening to the files sent.

FYI there is a massive oil field under the City of Long Beach, Ca.

that was discovered in 1921, and is one of the many prolific fields along the Newport-Inglewood Fault Zone, which is a major fault system running through the Los Angeles basin. In just 2 sq.miles it has produced over 1 billion barrels of oil. This field has the distinction of the highest recovery of oil per acre of any oilfield in the world. It is estimated that as much as 2 billion barrels of oil are still in place, with a vertical section of stacked reservoirs up to 10,000ft. thick, and plans to extract the oil continue apace. Subsidence of roads etc. due to the extraction of the subterranean oil has long been a big problem in the City of Long Beach, which is only 20 miles or so from Catalina Island. And there are also artificial offshore drilling islands offshore Long Beach that are the base for numerous directional non-vertical wells to tap into the offshore oil reservoirs.

Tectonic plate adjustments resulting in earthquakes due to oil extraction are a known industry problem, and have most recently made the national news in Oklahoma.

So the audio record about fears of tectonic shifts affecting the base does make sense from this perspective.

Incidentally I do recall a big flap about an alleged UFO crash off Catalina Island a decade or so ago.

Best
