

"Connectivities that you get for the acquisition of information includes the Others." (2:23)

[Begin Audio]

[REDACTED]n: (0:01) And the sponsor is interested in one dimension of that experiment and I'm interested in the second, Hal's interested in the third and here the dimensions are—I'm interested in the dimension of showing that quantum connectivity between two proven competent telepaths can be measured with simultaneity in terms of the portions of the brain that are activated.

[REDACTED]n [REDACTED]: (0:33) Uh huh. Mmhm.

D [REDACTED]: (0:34) That, that, that is now possible to do. I, I don't do the math but I know how to determine what portions of the midbrain connected to the caudate and the putamen connected to the prefrontal cortex and connected to the... part of the brain that does imaging...

[REDACTED]: (1:00) [Overlaps] Right.

[REDACTED]r [REDACTED]: (1:01) ...is all related to each other. That's something that right now is a very, very rich area of my world of MRI. Hal is the expert in knowing how to *design* the experiment.

[REDACTED]: (1:13) Okay.

[REDACTED]: (1:15) And the sponsor is interested in having an experiment design where the thing that you do and the thing that Uri does happen to be identical to each other.

[REDACTED]: (1:34) Mmhm.

[REDACTED] (1:35) Okay? Both you and [REDACTED] have asserted and in your case you have in my judgement proved, in [REDACTED] case I can't say... that the connectivities that you get for the acquisition of information includes the others.

[REDACTED] (1:59) Oh yes.

[REDACTED]: (2:00) Okay, now our sponsor is interested in the latter(?) ...

[REDACTED]: (2:08) Yeah, I know, yes, okay.

[REDACTED]: (2:09) Hal—Hal is interested in the former. I'm interested in the neurology...

[REDACTED]: (2:17) Right.

[REDACTED]: (2:18) ...and the genetics.

[REDACTED]y: (2:19) Mmhm.

[REDACTED] (2:20) Okay, so what the spon—
