FYI

One of the speakers at the Global Science Congress this year was [REDACTED] is President of American Computer Company <http://www.american-computer.com> and has an interesting background. [REDACTED] is an Electrical Engineer and has been involved with computers going back to its early days. He was the man behind the "Windows" technology that Bill Gates now uses as well as many other innovations. Because of his genius, [REDACTED] was approached by some intelligence operatives many years ago to take on a contract to back engineer some technology. [REDACTED] wanted to know where the technology came from before taking the contract. He was told that it came from the 1947 Roswell UFO crash. [REDACTED] did not believe them. The men said they would come back with more proof. They did and [REDACTED] took the contract.

Soon, Jack learned the that the transistor was not invented by AT&T but was part of the another back engineering process of Roswell technology, as was lasers, fiber optics, some other technologies. He then started researching this information.

In 1997 [REDACTED] posted a small article on his web site about the Roswell crash and the history of the transistor and back engineering Roswell technology. He got 100 replies the first 24 hours. He posted some more info and 1000 replies the first week. [REDACTED] articles where scaring AT&T and other corporations who claimed they invented the technologies as well as the intelligence agencies. There little secret was being exposed and they did not like that. It wasn't long before [REDACTED] started getting a lot cyber-terrorism against his company and death threats to put him out of business. [REDACTED] was harassed through e-mail and received deaths threats for over a year by one individual. He notified the FBI,

but they basically did nothing. By the way, [redacted] Jewish [redacted] finally learned the identity of this individual. It was Buford Furrow, the guy that shot up the Jewish Community Center in LA where [redacted] kids attend. None of [redacted] kids got hurt.

Not too long ago [redacted] received a strange fax that referred to a classified project. He asked his attorney what he should do. His attorney thought it might be a set-up (possession of classified material) and told him to give it back. [redacted] did not know who faxed it to him and thus who to give it back to. So, he thought he would call some of the intelligence agencies and tried calling the CIA. When speaking to the secretary he mentioned the project and the secretary immediately connected him to someone else. The man greeted [redacted] like he knew him without [redacted] ever revealing who he was. When [redacted] mentioned the project name, he was told that the name could only be talked about on a secure line. He told him he would get back with him and to hang up and [redacted] went away from the phone. [redacted] did. The man got in contact with [redacted] later by calling [redacted] cell phone which was unlisted. Soon [redacted] company was broken into and ransacked. When he notified the FBI, two goons were sent over to investigate, only they seemed to know where everything was like they had been there before. [redacted] was suspecting that they might have been the ones that broke in. He noticed they stole some stuff on their way out.

Some of [redacted] innovations involved super-computer technology that was stolen and given to Thinking Machines Corp. [redacted] filed a law suit which actually caused him to have to file more suits against other companies. [redacted] was winning his cases and companies were declaring bankruptcy. It just so happens that the theft involved the mob (the Gambino family) who tried to take him out several times. One attempt was by someone shooting at his windshield. When [redacted] law suites were finally going to make the mob appear in court they skipped town, down to Florida he believes, and he has not heard from them again.

At the conference, [redacted] talked about his experiences in the computer industry leading up to the present day. In the workshop [redacted] talked about the history of american technology, especially the transistor, and he proves that the transistor did not come from the research labs of our corporations. He also talked about how they have scrambled to cover things up during his own investigations.

Below is the original story on Roswell (primary focus on the transistor) that [redacted] posted on his web site. [redacted] has much more on his web site and you may want go there to get updated on his law suites as well as read other stories. He also has a mail-list you can sign up on for further updates.
