

L.A. TO N.Y. IN HALF AN HOUR !

(Los Angeles Times)

June 11, 1972

The Rand Corp. has devised a rapid transit system to get you from Los Angeles to New York in half an hour for a \$50 fare.

Existing technology makes such a system feasible, and so does a cost analysis. The idea of high-speed train travel using electro-magnetic suspension was first put forward in 1905 and actually patented in 1912.

The essence of the idea is to dig a tunnel more or less along the present routes of U.S. Highways 66 and 30. The Tunnel would contain several large tubes for the east-west travel of trains that float on magnetic fields, moving at top speeds of 10,000 m.p.h. This train or "Tube Shuttle" would be big enough to carry both passengers and freight, including large containers and automobiles.

On the main line there would be intermediate stops at Amarillo and Chicago. Feeder lines would meet the main line at both locations.

There also would be subsidiary lines coming from such cities as San Francisco, Boston and Washington.

The tunnels, are not as expensive to dig as people think. The most expensive thing about surface routes is in acquiring rights of way and removing buildings, etc. The Tunnel would not incur this expense. The tunnel could also carry, in the tubes, many of the utilities now strung across the countryside on high wires.
