Technonet is the protest form of the 1990s-picketing on the information highways. For example, a fast-growing assortment of men and women around the world are using the Internet (started by the US military for information transfer and exchange that would never be interfered with) to draw attention to a questionable military project in Alaska. Now these Internetting, e-mailing, faxing folks are blowing holes in the US Department of Defense secrecy wall by using the government's own system. The printed-word part of the protest started when Dennis Specht, an anti-nuclear activist then living in Alaska, sent a news item to NEXUS on the topic of HAARP-the High-frequency Active Auroral Research Program. Then, an Alaskan political activist and science researcher in Anchorage, Nick Begich, networked with Patrick and Gael Crystal Flanagan, who are self-described "technomonks" living in Sedona, Arizona, and was told to check out that same Australian-based magazine. Begich was surprised to see an item from his home town in NEXUS and immediately headed to the local library to dig out the documents cited in the article.

That research led to articles and the book, Angels Don't Play this HAARP: Advances in Tesla Technology, which is 230 pages of detailed information on this intrusive project. This article will only give highlights. Despite the amount of research (350 footnotes), at its heart it is a story about ordinary people who took on an extraordinary challenge.

HAARP BOILS THE UPPER ATMOSPHERE

HAARP will zap the upper atmosphere with a focused and steerable electromagnetic beam. It is an advanced model of an 'ionospheric heater'. (The ionosphere is the electrically-charged sphere surrounding Earth's upper atmosphere. It ranges between about 40 to 600 miles above Earth's surface.)

Put simply, the apparatus for HAARP is a reversal of a radio telescope: antennas send out signals instead of receiving. HAARP is the test run for a super-powerful radio wave beaming technology that lifts areas of the ionosphere by focusing a beam and heating those areas. Electromagnetic waves then bounce back onto Earth and penetrate everything-living and dead. HAARP publicity gives the impression that the High-frequency Active Auroral Research Program is mainly an academic project with the goal of changing the ionosphere to improve communications for our own good. However, other US military documents put it more clearly: HAARP aims to learn how to "exploit the ionosphere for Department of Defense purposes". Communicating with submarines is only one of those purposes.

Press releases and other information from the military on HAARP continually downplay what it could do. Publicity documents insist that the HAARP project is no different than other ionospheric heaters operating safely throughout the world in places such as Arecibo, Puerto Rico; Tromsø, Norway; and the former Soviet Union. However, a 1990 government document indicates that the radio frequency (RF) power zap will drive the ionosphere to unnatural activities:

"...at the highest HF powers available in the West, the instabilities commonly studied are approaching their maximum RF energy dissipative capability, beyond which the plasma processes will 'run away' until the next limiting factor is reached."

If the military, in cooperation with the University of Alaska, Fairbanks, can show that this new ground-based "Star Wars" technology is sound, they both win. The military has a relatively inexpensive defence shield and the university can brag about the most dramatic geophysical manipulation since atmospheric explosions of nuclear bombs. After successful testing, they would have the military megaprojects of the future and huge markets for Alaska's North Slope natural gas.

Looking at the other patents which built on the work of a Texas physicist named Bernard Eastlund, it becomes clearer how the military intends to use the HAARP transmitter. It also makes governmental denials less believable. The military knows how it intends to use this

technology, and has made it clear in their documents. The military has deliberately misled the public through sophisticated word games, deceit and outright disinformation.

The military says the HAARP system could:

- * give the military a tool to replace the electromagnetic pulse effect of atmospheric thermonuclear devices (still considered a viable option by the military through at least 1986);

- * replace the huge Extremely Low Frequency (ELF) submarine communication system operating in Michigan and Wisconsin with a new and more compact technology;

- * be used to replace the over-the-horizon radar system that was once planned for the current location of HAARP, with a more flexible and accurate system;

- * provide a way to wipe out communications over an extremely large area, while keeping the military's own communications systems working;

- * provide a wide-area Earth-penetrating tomography which, if combined with the computing abilities of EMASS and Cray computers, would make it possible to verify many parts of nuclear nonproliferation and peace agreements;

- * be a tool for geophysical probing to find oil, gas and mineral deposits over a large area;

- * be used to detect incoming low-level planes and cruise missiles, making other technologies obsolete.

The above abilities seem like a good idea to all who believe in sound national defence and to those concerned about cost-cutting. However, the possible uses which the HAARP records do not explain, and which can only be found in US Air Force, Army, Navy and other federal agency records, are alarming. Moreover, effects from the reckless use of these power levels in our natural shield-the ionosphere-could be cataclysmic, according to some scientists.

Two Alaskans put it bluntly. A founder of the NO HAARP movement, Clare Zickuhr, says: "The military is going to give the ionosphere a big kick and see what happens."

The military failed to tell the public that they do not know what exactly will happen, but a Penn State science article brags about that

uncertainty. Macho science? The HAARP project uses the largest energy levels yet played with, by what Begich and Manning call "the big boys with their new toys". It is an experiment on the sky, and experiments are done to find out something not already known. Independent scientists

told Begich and Manning that a HAARP-type 'skybuster' with its unforeseen effects could be an act of global vandalism.
