 Subject: FW: Review of the patent office action

[REDACTED]nd Steve,

EXTREME CLOSE HOLD. EYES ONLY. With your concurrence, I have permission from Lee Kenny to fully fill you in on an action that has just been received from the U.S. Patent and Trademark Office. This is a copy of my initial E-mail to Lee, after reviewing the action received.

I personally think this is one of the cleverest traps of all time that has been laid for us. We will be answering this action, of course, and very strongly. But in my opinion we may be going to need all the help we can get on this one, from other aspects such as political etc.

To fill you in, I have about a mail box (10 Megabytes or more) of PDF files to send you, that is the action itself and the reference continuation.

Please send me a time tomorrow or Sunday to start E-mailing you the files. I can divide that mess into three sections or so, with a wait between them as desired, so you can download your mailbox between sections and not have it jammed and stuff refused.

Hope things go well with you and family.

Best wishes,

[REDACTED]

[REDACTED]

I've finished reviewing the patent action from the patent office, and we greatly need to talk. This is not at all what it appears on the surface. Don't want to write it in an E-mail, but will spell it out for you in person.

We also must know whether [REDACTED] did file the other continuation with the Aharonov-Bohm stuff in it that we sent him. It was my understanding this had been filed prior to Christmas. We need to know that it was or wasn't, and we

2/22/04

need a full copy of what he filed, if he filed it.

Let me put it this way. This is probably the cleverest trap I've ever seen, and extraordinarily well disguised. It's also a far worse trap than we even speculated, were we not to recognize what the bait really is and how the trap is set.

Either this one has been extraordinarily cleverly engineered, or the patent examiner stumbled into it unwittingly. Either way, it is an extraordinarily dangerous trap.

If Norm filed the other continuation, we can then proceed in one direction that is a bit awkward but not too bad. If not, then in another direction but Herculean effort is required. Not to worry; we can do it, whichever way is required.

And the way the trap is set, one cannot just abandon this continuation. That is NOT what is involved, and that is NOT an option.

Nonetheless, the action itself has a strong level of incompetence, as we noticed already. The examiner does not even know the difference between efficiency and COP, for example, and appears to have no knowledge of nonequilibrium thermodynamics. One of his serious mistakes is to blandly point out that $COP > 1.0$ violates the first law of thermodynamics (conservation of energy) which is quite false. If $EFFICIENCY > 100\%$ were claimed, that would be a violation of the first law. In short, a solar cell array electrical system has a $COP = \text{infinity}$. According to the patent examiner, a simple solar cell array is impossible because it is in violation of the conservation of energy law, which is ridiculous. Etc. We can easily handle all such objections, including with rigorous references and examples.

However, we must know the status of that other continuation, and we must have a copy of it ASAP — if it was filed as we understood and is in the patent office now.

Give me a call tomorrow morning when convenient for you. We need to talk!

Cheers,

2/22/04
