*Energy Δ E
moving Devices!*

Dear Steve,

FYI. The following excerpts are from a long (as usual) [REDACTED] assessment of what may have happened to the Steorn motor and why it failed. We must be aware of these issues as we move forward. [REDACTED]

1. Location change effect:

The point is, every location has its specific "archetype" or "pattern" of its dynamics exchange with its locally occupying matter and systems. Even the intent in the mind of the inventors affects the local archetype over time, since mind dynamics is in the time domain, and – from a quantum field theory viewpoint – thus involves scalar (time-polarized photon) activity and exchange. Quoting Tiller:

"Most people concluded from this that the inventor was either (1) not a careful investigator, (2) was imagining his earlier results, or (3) was practicing fraud. In this, everybody makes the implicit assumption that one space for this experiment is the same as another, that one collection of equipment is the same as a set of physically identical equipment and that one careful experimenter is the same as another careful experimenter. Our accumulated data of the past seven years shows, unequivocally, that this assumption is false." [William Tiller in Vol. 10, issue 58 of Infinite Energy magazine. Author Addendum]

So when the Steorn group moved their demonstrator from its usual Irish location of several years, into a new site to set it up, they may well have run into the "different archetype" and "different vacuum dynamics" effect. If so, the unit would then demonstrate different and unusual effects in the new location that were "responsible" for its problems. Specifically, it could demonstrate COP<1.0, or mechanical difficulties.

(2) Quantum Potential interference

In short, if you establish this quantum potential connection between the distant targeted object and an elemental target in the lab, then by merely placing a desired EM signal or effect in that lab object the identical effect or signal appears instantly in the distant target, without any "travel through intervening normal space at light speed".

If one changes the input signal into the lab "entangled" sample, then instantly the same change appears in the distant entangled targeted system.

It would have been quite normal practice for the High Cabal (the evil parts of those high cartels) to "disarray" and destroy the Steorn demonstration by whatever means was convenient and necessary, to deliberately make it a failure. E.g., using a quantum potential connection, one could introduce EM drag forces in the lab device, that dramatically increase drag on the bearings to burn them out or destroy them, and voila! The exact same effect instantly appears and happens in the distant targeted device(s). So Steorn could change the bearings in their unit out there at the demonstration site, and it made no difference. The QP-induced effect simply reappears in the new bearings, causing them to fail also.

Because of the failure of several sets of bearings in the new location, I strongly suspect that the High Cabal just hit the Steorn device with a quantum potential carrier of a drag force effect specifically designed to ruin the quite sensitive bearings. In a normal situation, if one set of bearings had a hidden defect and failed, then a new set should have cured the problem. It did not do so, hence one concludes the situation "was not normal".

Anyway, one of those two possibilities is what happened to the Steorn group's planned decisive public demonstration. Because of the specific indicators, the probability is more than 80% that it was due to a hostile QP interference, in my opinion.

=
