BTW how much DNA is not matching? JD told me 10%.

Also is there an estimate on how long ago he died? Anything more on the DNA clock or Carbon testing? Steve

By the way—the website I am thinking about will also make sure there's the open question of the unmatched DNA, etc. I am also thinking about how to appropriately add "epigenetics" and other issues previously discussed.

The mystery continues, including the notion there are more of these things supposedly—including the thing in Russia.

Excellent!

If you have time Thursday sometime please give me a call - We will do a press release next week early on the specimen and I'd like to get up to date on what you have found so far.

Thanks! Steve

Erin is one of the best graduate students I have had. He was co- first author on my lab's now well-known Science paper on mass Cytometry in 2011 (see attached).

Last couple of years I have been "indoctrinating" him into the area. At first he was annoyingly skeptical... as I kept showing him the evidence and letting him look at it he's come full circle.

He's a postdoc at UCSF now.

Nice.

The Atacama specimen looks a bit like "Alexis of Kyshtym" discovered in 1996. Here is the most informative account on Alexis that I found, though the English is poor:

The video at the end is the highlight.

I wonder if you'll get the opportunity to do deep sequencing on "Alexis"... If this is due to a rare mutation, then having a 2nd sample might reveal it.
