

ATTENTION: DR. GREER !@ C-SETI

9-27-98

DEAR DR. GREER:

HAVING LISTENED TO ART BELL ON FRIDAY EVENING (9/25) I WAS HIGHLY EXCITED BY THE PROGRAM TOPIC, AND LISTENED CAREFULLY TO WHAT YOU HAD TO SAY.

I HAVE BEEN INTERESTED IN ZERO-POINT OR NET-GAIN ENERGY DEVICES SINCE 1991, WHEN A GUEST LECTURER AT OUR LOCAL ELECTRIC CAR CLUB MENTIONED THEM IN HIS TALK. AFTER VIEWING MR HOAGLAND'S SPEECH TO THE U.N., AND ATTENDING TALKS GIVEN BY DR. BRIAN O'LEARY (AN ISLAND NEIGHBOR) I HAVE BECOME CONVINCED OF THE SOUND POSSIBILITY OF SUCH DEVICES.

IF YOU HAVE ACTUALLY FOUND A WORKING NET-GAIN DEVICE, I AM VERY MUCH IN SUPPORT OF ANYTHING THAT CAN BE DONE TO BRING IT TO MARKET.

I HAVE BEEN BUILDING A PROTOTYPE H.E.V. SINCE 1994, IN THE HOPE THAT I COULD DO SOMETHING SUBSTANTIVE TO DECREASE OUR USE OF FOSSIL FUELS. IF A NET-GAIN DEVICE WERE TO REPLACE THE ON-BOARD A.P.U., SOMEBODY WHO COULD TEST/EVALUATE SUCH A DEVICE, IN A READY-MADE PLATFORM, COULD SUBSTANTIALLY FURTHER YOUR EFFORT.

ACCORDINGLY, I AM OFFERING THE FREE USE OF MY PROTOTYPE, AND MY CORPORATION, TRIDENT H.E.V. LTD., TO HELP ENGINEER, TEST AND EVALUATE THE WORLD'S FIRST NET-GAIN AUTOMOTIVE PROPULSION SYSTEM.

The **TRIDENT** is a hand-crafted, sophisticated exotic vehicle for two. Constructed of epoxy-bonded composite materials, the monocoque chassis is light but strong, and the modular subsystem permits the vehicle to be updated as E.V. technology develops.

The Trident is part of an emerging new technology know as hybrid/electric. Hybrid vehicles use an auxiliary power unit, or A.P.U., to provide extra energy on demand for hill-climbing, rapid acceleration, and extended range. When commuting short distances or driving in town, pure electric operation is chosen. Battery recharging can be accomplished either by A.P.U., or a standard 120V AC outlet.

The Trident is designed as an enclosed motorcycle, making registration/inspection and insurance simple and economical.

Environmentally considerate, exciting to drive, and capable of an extended service life, the Trident bridges the gap between present and future electric vehicles.

[REDACTED]

UNDERSTANDING THE NATURE OF THE CONCERNS YOU NATURALLY WOULD HAVE RE. THIS TECHNOLOGY FALLING INTO THE WRONG SORTS OF HANDS, (THOSE WHO WOULD VILIFY / SUPPRESS IT) ALL I CAN SAY IS THAT I AM MAKING A SINCERE OFFER TO HELP, IN THE ONLY WAY I AM CAPABLE; YOUR ASSESSMENT OF MY CREDIBILITY / CHARACTER WILL, I AM SURE, BE POSITIVE.

I MAY BE CONTACTED BY PHONE / FAX, 24 HOURS

[REDACTED]

IF YOU WOULD LIKE TO SCHEDULE A TRIP TO THE ISLAND TO VIEW THE PROTOTYPE AND TALK WITH US, OR SIMPLY TO GET AWAY FOR A SHORT TIME, YOU ARE WELCOME TO STAY WITH MY WIFE AND I IN [REDACTED]

I KNOW THAT YOU ARE A BUSY FELLOW, BUT I WOULD GREATLY APPRECIATE ANY FORM OF ACKNOWLEDGEMENT THAT DR. GREER HIMSELF HAS READ THIS FAX.

ALOHA [REDACTED]

HOW DO HYBRIDS WORK?

What's the most efficient way to use the energy in gasoline? Right now, it's by merging an ultra-high-efficiency gasoline engine and an energy-balancing electric drive system.

Part of the reason gasoline engines have so many pollution-control problems is because of the constantly varying loads and RPMs they are subject to in a conventional drivetrain.

By mating the engine directly to a generator, load and RPM become constant, with the battery bank acting as a 'load-leveling' device. Using an electric motor to drive the wheels allows the transmission to be eliminated. The resulting vehicle uses fuel much more economically, and because the gasoline engine is running at a constant speed, its emissions can be reduced / controlled more effectively.

Hybrid vehicles enjoy prolonged service life due to the fact that all systems are operating at their ideal efficiency and load, which translates to lower operating costs for owners.

The D.O.T. has published a study showing that the average American driver's trip lengths are below 15 miles 80% of the time. For such short excursions, the Trident can rely exclusively on battery power and so provide zero-emission transport.

Until research and development efforts provide vastly more compact, efficient, and cost-effective battery or fuel-cell designs, hybrid vehicle technology presents the best alternative to conventional transport. And because hybrid vehicles allow rapid refueling convenience via an established infrastructure, they represent a viable long-term consumer choice compared to pure electric vehicles.

TRIDENT DEVELOPMENT PROGRAM OUTLINE

Phase I Program (5 year duration)

Design and construct initial prototype vehicle as demonstration platform to "proof" concept and help attract funding for Phase II.

1. Provide simple, sophisticated two-passenger vehicle utilizing hybrid-electric and modular component design techniques, resulting in low-weight, high-performance, attractively styled platform, allowing registration as a motorcycle class vehicle.
2. Test and document.

Phase II Program (12 month duration)

Use data provided by Phase I results to design and construct a single-pre-production market-ready demonstration vehicle.

Goals

1. Demonstrate / display / advertise prototype vehicle
2. Collect sufficient pre-production order deposits from test-market areas to permit construction and start-up of assembly plant.

Phase III Program (24 month duration)

Establish production facility and subassembly supply network in Hawaii, to manufacture / distribute Phase II design vehicles.

Goals

1. Provide broad-base economic benefit to local communities by utilizing subcontracted parts suppliers instate.
2. Provide employment opportunities for assemblers/production line workers within local community.
3. Produce 150 units in first 12 months, 300 units in second 12 month.

MARKETING PROFILE

- Generates appeal as high-status, high-technology, environmentally benign vehicle design
- Primary Market: Qualified collectors of unique, hand built, quality, limited production automobiles and motorcycles
- Secondary Market: Qualified high-profile, environmentally proactive buyers
- Emphasis on:
 - Leading-edge hybrid technology
 - Monocoque designed composite chassis
 - Racing design suspension and brakes
 - Low-drag body profile
 - Low emissions / high efficiency
 - Passive and active safety systems
 - Programmable performance parameters via laptop computer
 - Very low maintenance requirements / long service life
- Performance envelope as: Lotus, Morgan, MG, et al

- 
- Other potential markets exist for the development of a utility-grade version vehicle for sale to municipalities, utility companies, and similar end-user consumers.
 - The proposed production method, which involves the integration of subcontracted components and chassis/body elements at a central inventory control and assembly facility, could be marketed as the key point in a franchise package plan.
 - The absence of industrial processes at the assembly facility simplifies permitting, licensing, and insuring the plant, and the use of subcontractors for all components assures broad-based local economic benefit, while encouraging excellent quality control.
 - The independent module subsystem design of the Trident allows the upgrade-retrofit of future advances in A.P.U.s, energy storage systems, and drive components as they emerge, enhancing and extending vehicle's service life, without redesign or modification of the central platform.
