Dear [REDACTED]

Validating [REDACTED] machine is simple. We no longer have it working but my son [REDACTED] has all the components stored at his place. I'm sure he could be induced to put it together again if he had the finances to use up his time – but [REDACTED] as much, much more.

There are dozens, if not hundreds, who've validated the [REDACTED] machinery to be found online. They used bicycle components & car batteries. Look under either [REDACTED] online. Our input was a 12 volt car battery. Output was several 12 volt car batteries.

There's no way that anyone can measure current going into the battery, so far as I know, because Ohm meters measure resistance. The current abstracted from the vacuum is of an opposite nature and does not show up as resistance. We did use a radiometer to assure ourselves we had a flow of current toward the batteries to be charged, but of course we had to wait until the batteries were loaded before we had any kind of quantitative measurement, at which time we could use an ammeter.

Attached herewith is our write up on the whole experience.

With apologies to your electrical engineer – his background may be the wrong one to delve into this subject. Try, instead, a very modern physicist. After all, it's the modern physicist who has discovered that the vacuum holds untold amounts of "free" energy. If you have any further questions, please let me know.

Oh yes! The US patent office has clamped a security lid on a thousand "free energy" inventions. Do you suppose this was done just to confuse us? See 130 Electrical Energy Innovations above.

I'm convinced that extra-terrestrials use this kind of energy and that CartanEinsteinEvans description of the universe permits faster than light travel as limited by EinsteinRieman geometry.

Subject: to [REDACTED] - a question from Dr. Steven Greer

Dr. Greer asked me to follow up on something you wrote to him in your letter of March 15, 2014.

You said in the first line that you had validated Bedini's free energy machine.

Dr. Greer has had 2 very experienced engineers who went to Bendini workshops, bought the most expensive kits etc. and were never able to get the machines to work and could never find anyone who had built one that was working that they could test. If you have in fact validated those plans it would be excellent.

Would you please let us know?

- 1) Do you still have the machine working?
- 2) What is the input?
- 3) What is the output?
- 4) Is it running a load? How big?
- 5) How long does it run?
- 6) How are you measuring these parameters?

If you could provide as many details as possible it would help Dr. Greer immensely.
Thank you for your help.
