

Update on Inventions 103002

EXTANT

[REDACTED] Now ready to deal, according to Dr. Mallove. Has seen 50 watt in/ 500 watts out performance, though load is specialized and needs to be clarified. Ted impressed by videotape. SG handling.

[REDACTED] Claim to have a continuously operating 5 kilowatt device with no power input (negistor). Spoke to their attorney 1021. They have requested \$50K to commence testing. JK told him we needed evidence of how the gain was computed, and would not pay the requested \$50K until/unless vetting confirmed results. 1030: Clarified that they want the \$50K for a better prototype, current prototype is not pretty. Ready to demonstrate. Champagne would visit us. [REDACTED] is inventor. Using digital wattage meter. No input power. Current machine powers [REDACTED] house. Been powering it for 1 year. Make arrangements with [REDACTED] the attorney. Perhaps device won't clear Customs.

[REDACTED] (EMILIE). Claims to have working device, tested by EE's to produce 2 watts from 1/16 watt input. Valone now believes this is potentially very significant, and has offered to consult to Sprain on a regular basis, helping with both patent preparation and device improvement. He believes the RPM's can be increased from 160 to potentially 16,000 (more likely, 10,000) thereby creating a linear increase in wattage from 2 to 200. By stacking 5 of these like pancakes, a kilowatt would be produced. 1030: now testing with Valparaiso, first in DC wattage in/out test. That is to be done 1031.

[REDACTED] showed us a levitating solar generator that he is willing to license. It looks scalable. [REDACTED] stresses that he doesn't know the efficiency, but believes it will be good. 100802: He wants to build a better one before licensing it.

[REDACTED] has access to people with lithium battery supercharger, fuel cell, organic to fuel (NG) conversion system, and knows how to convert existing cars to fuel cells. He promised a package including electric car info. (quick charge battery system) and gas plant (NG) to be sent by Friday 10/25. No package as of 1030.

[REDACTED] Has 7 inventions, including Etherizer that dissolves materials and 80 MPG car (perhaps doubling of mileage, perhaps a little less), has run his home off-grid for 14 (?) years excluding inductive applications such as dryer. JK sent Weiss AIP. Weiss says Ward wants to handle everything through him. JK sent Weiss AIP for 80 MPG fuel saver, battery charger, and Nova Plasma (etherizer) machine. 1029: Ward and Weiss have signed AIP. Now awaiting SG signature. Has sent fuel saver device to SG.

Holm has completed one version of his device, and it ran for 2 weeks. Dax Hamilton has agreed to build it after he finishes our Muller contract (late November or early December).

[REDACTED]

Holm developed alternative device design, but Wilcken discounts that device as insignificant. Rick Foch seeking fabricators, to respond by 1101, for this as well as Comings.

[REDACTED] is wanting \$41K paid to his group to produce two RS-3 units. Because we would have no real control of this expenditure or possible cost overruns, I told him that we couldn't fund it at this time. He will be happy to do this for us when we are more comfortable with the risk level.

[REDACTED] Meader is willing to work from a known successful replication (e.g. Magraden) not from Lindemann's plans which he considers incomplete. 1022: again asked Wilcken to contact Magraden or give JK contact info so we can attempt replication from a working prototype. Magraden will not supply his device or build one, is willing to supply his design. However, Wilcken emphasizes that this is a 3 - 4 month FT project. More practical may be limiting the development to just the core and a pulsed input, with capture of back EMF through a copper cage.

[REDACTED] recommends we buy the [REDACTED] for a test platform. This connects to any device, and enables you to determine if you have OU performance and to what level. Microprocessor platform that gives a true reading of performance. \$1400. Unlike digital watt meters, allows you to adjust pulse width and amplitude (important for devices such as [REDACTED]). This would allow SEAS to measure AC more accurately. This also allows immediate, accurate results on any purported OU device.

[REDACTED] our intern, has built the [REDACTED] POD but it doesn't perform to the expected specs. Harwood is coaching him via e-mail. Harwood also claims one of his replicators will submit a completed functioning unit for the Z Prize, and that a Tesla patent shows how to do it to industrial size. Wilcken thinks this is similar tech. to the Gray device; back-EMF based. [REDACTED] as declared that our prototype "is" over unity. Wilcken now questions Harwood's judgment. We have politely asked him to put up or shut up.

[REDACTED] Wilcken visit not scheduled. Dax promised bids to make unit from scratch and from Adsit design by 100402. Dax is building two motors for a total of \$3,250 for delivery by 120402, inclusive of all the electrical components (windings and metglass). He claims this will be a complete working motor built from scratch. Adsit motor (from partially completed prototype Wilcken supplied him) is taking in 120 watts and putting out 110 watts—a highly efficient motor, but not OU. However, an optical switch will be added per Wilcken's instructions by 1104 that may make it OU. Norm Hays will be consulted on one electronic circuit design. Also, the newly constructed one (due 1204) will not lose power due to vibration and poor tolerances.

[REDACTED] Friend of [REDACTED] Claims to have hydrogen to water conversion engine, but is unwilling got license it. JK asked Fred to approach about JV company 093002. No response 100702.

[REDACTED] Similar to Cole Motor (see above). Recently dropped US rep, who was an evangelical Mormon (disliked for this by both Wilcken and Dax). I have written them in S. Africa offering to work with them. No response. SG to call them in S. Africa.

[REDACTED] Has documented (CA and other tests) showing 25% increase in mileage. Improvable.

[REDACTED] reportedly has 80 MPG car. Accessible via A. Weiss.

[REDACTED] ready to build. Moves a ball around a track endlessly. Again asked him for proposal for larger unit to produce 1 KW, 093002. Expects grant to build smaller version first, 100602.

[REDACTED] Spoke again after 10 years. Remembered me. Said Boeing tests "proved" the concept; Jamie Childress says they were inconclusive and that Cook was given everything he needed by Boeing to eliminate the vibration problem, but nothing has happened in 2 years. Cook says he needs \$50K (\$20K income) to make it right. JK asked Cook to clarify 100102. Asked again 100702.

[REDACTED] Claims his group has well-documented catalyst that increases mileage by minimum 23% and eliminates diesel particulate emissions, improves coal BTU's and drastically cuts emissions. Claims extensively documented over 10 yrs. NDA signed and data expected this week. Samples received 1020. MPG savings rise over time; can reach 60%+ improvement. We need to get baseline data for vehicles at test facilities.

[REDACTED] Fuel vaporizer. Sending a fuel injector retrofit kit for our use 1028. Seeking Range Rover owner testimonials for us. Has seen 30 - 60% increase in MPG.

POSSIBLE

[REDACTED] claims his mechanical over unity motor is nearing completion, to be tested by them by first week of November.

[REDACTED] also has a catalytic converter for H2O2. He claims to have an OU device nearing completion. He is preparing the Resonant Signature device to operate automatically.

[REDACTED] is on hold until he can demonstrate something.

[REDACTED] is building his device, and presently doesn't need funding.

[REDACTED] K spoke to President of company and an investor. Carol knows developer, and he promised her a device by October. Carol is talking to him again first week of November.

[REDACTED] Has specs for gravitational converter. Expects completion by 1201. Asked \$20K. JK requested specs for evaluation 1024.

[REDACTED] Based on their comments to me, they are not going to bring this to market successfully. The new demo is still to be rescheduled. [REDACTED] believes they have a real, functioning Gray replication. Promised a road test last week of October.

[REDACTED] has referred another inventor FIZZIONE who seems to have scientific credentials and an interesting device, but there is nothing testable.

[REDACTED] Simulation cannot be done because software cannot model an aspect of his system. Seeking Alberta state funding. Will not collaborate with SEAS unless we visit him; cannot visit US.

[REDACTED] Told [REDACTED] that he will call SEAS first when he has a device to demo.

[REDACTED] Failed to keep his promise to SG in Oregon.

[REDACTED] Has built the device to specifications, needs to refine one component. Dax believes he is very close to a testable unit. Needs additional input from Bedini.

[REDACTED] Dropped by Boeing, spoke with [REDACTED] He and [REDACTED] have developed a cordial and respectful relationship. [REDACTED] says a university is planning a proposal to research this, and will refer them to [REDACTED] for possible collaboration.

Magnetic Energy Converter. Have a serious if conventional business plan based on Godin's Russian technology (that Valone takes seriously), and expressed interest in collaboration with SEAS. Their COO promised to read the Strategic Overview and get back to me. COO Kruglak has not responded to my calls and letters since.

[REDACTED] Has magnetic device with promising design. Writeup received and faxed to Wilcken 100202. Wilcken says no merit demonstrated.

[REDACTED] [REDACTED]. Claims to have centripetal generator, prototype nearing completion.

[REDACTED] Claims to have force amplifier (lever). Complex, obtuse plans. Submitted to Wilcken for review. Wilcken finds him nearly impossible to talk with. I told him to limit brain damage.

[REDACTED] [REDACTED]. Claims to have gravitational propulsion. JK offered to sign NDA. No response. Wrote again 100502.

[REDACTED] His device has no new physics, according to [REDACTED] However, claims to have metered reduction of power consumption by 75% on motor. Was to call Wilcken 100102 and have [REDACTED] report to JK. 1025: still hasn't run Wilcken's test.

[REDACTED] [REDACTED]. Would not work with us except if we paid him thousands under contract for consulting. Would not divulge even under NDA. SG to contact him.

[REDACTED] [REDACTED] Well-regarded by Wilcken. Wrote Alek 1004 asking for a demo of his unit. No response. He is preparing for a public presentation in November.

[REDACTED] Ph.D. in physics, had design that was patent pending. Needed permission of investors to talk to SEAS. Failed to respond to multiple contacts. SG to contact. No telephone number given by Carpenter; e-mail is [REDACTED].

[REDACTED] [REDACTED]. Russian thought well of by [REDACTED] His attorney consistently fails to call back.

[REDACTED]. Claims to have electricity from tap water device. Were unwilling to license SEAS. JK wrote them about J.V. possibility 092902.

[REDACTED]. Claims to have invested \$5MM and to have another \$15MM raised. Wants to collaborate but will not license SEAS. JK wrote them about J.V. possibility 092902.
