In a paper published in June, 2000, V.V. [REDACTED] two Members of the Institute for High Temperatures, Russian Academy of Sciences, Moscow, describe some amazing magnetic-gravity effects they have achieved on the lab bench that parallel the breakthrough Anti-Gravity research results released this year by Brazilian physicist Fran de Aquino.

The Russian device, loosely derived from the legendary Searl Generator, exhibited the following anomalous characteristics:

The rotor of the converter self-accelerated.

At 550 RPM, the weight of the device changed rapidly.

The weight also depended on the power removed into the active load.

The weight ultimately was reduced to 35% of the initial value.

In a darkened room the converter rotor had a blue-pink luminescent coronic discharge.

The device created a vertical magnetic wall around the installation, with sharp edge separation.

There was an abnormal fall of temperature of 6-8 deg C in the lab, and also within the magnetic walls, which could be clearly felt by hand.

To quote from the Paper:

"All the results we obtained are extremely unusual and require some theoretical explanation."

The complete paper (in English) can be downloaded from the CSETI Website.

A Department of Energy spokesperson commented to CSETI:

"we have not been able to find any fault with the theory or the experimental setup that Dr. De Aquino supplied nor have we found fault in Dr. Godin's experimental work in Moscow. Both experiments offer insight into controlling gravity and inertia through electromagnetics and should provide a good basis for development of improved experiments and theory."

Onwards and upwards (literally!)
