Use

Thanks, Steve and [REDACTED] I agree completely, but have to prepare some increasingly-long comments which will not seem "conspiratorial", yet will convince other expert scientists in the field that they are technically incompetent. Ridicule is always best.

There was a similar intel conspiracy against "crop circles" in 2011. Richard Taylor was a Prof. here in Sydney at UNSW (my friend there knows him, on the same faculty). He has never (or hardly ever) been to see a real crop circle so far as I am aware. Then he wrote a big fake article and got lots of support for his research in Oregon

http://www.iop.org/news/11/aug/page_51614.html They even got Michio Kaku to support his debunking theories on Fox News <https://www.youtube.com/watch?v=3jRo1PCwYXg>

I chatted a few months later with Rob Irving, a smart guy who runs crop circle debunking in England (> 150 IQ). Even he did not know this scam was going to be pulled off, through the journal *Physics World* in Bristol. There are so many intel-associated guys in crops, that I no longer get angry at them, but just chat in friendship and see what I can learn? Most of them are just doing a paid job. So I followed up with a factual rebuttal

<http://www.cropcircleconnector.com/anasazi/time2012a.html> They won't do it again, too embarrassing for their reputations.

Thus I am working on a similar if hopefully-brief rebuttal of [REDACTED] and colleagues now, which you can/should test on other expert DNA scientists in the USA? There are a lot of small technical points which have to be addressed, so that other scientists will agree with the criticisms. It is still possible that the many novel mutations which they see are real, and due to cross-hybridization with another humanoid species (most are heterozygous on one chromosome only, say just from the father)? There is no way to tell for sure, because they have not done proper controls, and I do not have easy access to the sequence data plus programs needed to analyse it.

So we have three hypotheses: (1) all artefacts of age, (2) new Nobel-Prize winning "alien baby syndrome", or (3) past hybridization with an unknown humanoid, metaphorically akin to Neanderthal or Denisovan. The paper is written so densely that we cannot say for sure. Yet does their chosen hypothesis (2) seem likely from a conventional medical perspective? Only once in all of recorded history?

Best wishes, chat tomorrow on the phone, Horace in Sydney

P.S. They showed "Unacknowledged" here some months ago to a large UFO crowd, I thought it was very good! Well received in general. Good work.
