[REDACTED]

the 97% aligning against a human reference genome : I note that chimps and gorillas are around 98%, so does this mean that the specimen has more genetic divergence than modern great apes and chimps? Am I interpreting this correctly? Fascinating if so! Steve

[REDACTED] & Steve,

Deep sequencing on the best machine with newest technology:-- see below.

The library we made is ready to be "clustered". That means "local amplification" on the illumina chip readers

<http://www.youtube.com/watch?NR=1&v=I99aKKHcx4&feature=endscreen>

The "small scale" run of 50 million reads was 97% aligning against a human reference genome—which is excellent. The high % alignment means the specimen is a hominid with high similarity to humans. That sequence took 3 days. The DNA extraction was superb because the SPECIMEN preservation was superb. All good.

The new run is going to take 2 weeks. Sorry... this is just how it is. Now, I am going to let them get started and THEN I am going to ask them to give me the dataset about half way through. That means only half the reads. It doesn't stop the process or interfere with their machine, it just allows me to get a sampling of the state of the sequence output to date. There is going to be a LOT of grumbling from them about my request which is why I want them to get it started first. ☺

I am working with several people right now to interpret the current DNA sequence. I don't want to jump to any conclusions so this will take a couple days. We will get a LOT of info from this set of reads.

More later when I know more...

Hi [redacted]

Since Illumina calc is a little optimistic we are running 4 lanes. The library is in queue to be clustered this week for a sequencing run **beginning early next week. The run will take 2 weeks of machine time** and there will be at least a few days for data extraction.

Best,

Can you please get a PTA number for this genome sequencing I am doing please? Use my endowed funds.

Hi [REDACTED]

Based on the Illumina coverage calculator for a human genome, the new Hiseq with v3 chemistry should be able to yield 30x coverage in up to 2.5 to 4 lanes!!! So lets go with 3 lanes on Hiseq at this time. OK? I am almost ready (just re-run a bioanalyzer analysis and qubit) to submit your sample but waiting for a PTA# from you. Also I would need a very brief description about your sample. Thanks.

Best regards,

[REDACTED]

Hi [REDACTED]

Do not worry about the preliminary statistics I will run this. Essentially, Ji just wants to cautious and make sure that the reads actually align to the genome.

We will let you know later today how soon we can get data back to you. We are putting a rush in it.

Best,

[REDACTED]

Ji,

I will do the form this afternoon. Please assume I REALLY want to get the 30x coverage and there is no "if" I have no problem paying for the 8 lanes.

As to getting more complete sequence... I am in a huge rush for this. What can I do to move this along as fast as possible.

Hi 

Please let's know preliminary statistics of the sequencing analysis to make sure the input DNA and library are indeed what you expected before Hiseq run would be considered. Also you may need to consider to run the PE sample on the Miseq (PE150x2 or PE250x2) as a further testing run so we could maximize Hiseq sequencing efficiency.

I am going to work on the PE library sample to further quantify accurately then prepare to submit to Hiseq. If you would want a 30x coverage we may have to run up to 8 lane (a full flow cell) on the Hiseq and the estimated price is \$2100 per lane. Please have a PTA# ready for a prompt sample submission.

Also please email me back the sample submission form and SU13 for the GA run and library prep. Thanks.

Best regards,

I see. **These** are short reads. To get a quicker answer.

Yes, I definitely want to get the longer reads ASAP. What can I do to enable this?
