not sure if this is new or not, but figured I'd better forward to you....

Subject: Electrodynamic propulsion validated recently

Dr. Greer,

Thank you for your work. Below are two websites that, by recent (Oct. '01) experiments, show (video) of electrodynamic (Biefield / Brown) propulsion.

[REDACTED] is a retired engineer with a home lab/shop set up to validate alternative energy and gravitation/propulsion. He has recently posted his results of a working craft that accelerates and hovers vertically with only electrical potential. It is not ionized airflow but electrodynamic flow inertia (T.T. Brown). No moving parts.

Please take two minutes to review the video and potential. Demonstrating this at any of your conferences will show unequivocally a working antigravitic drive. It works...no ambiguity...the only "strings" used are those to hold it down to the wood table so it will not crash into the ceiling.

I am an engineer at Xerox and I am briefing other engineers on this new lesson in physics. (New to them anyway).
