Space Energy Access Systems
[REDACTED]

Gentlemen;

I received your E-mail and would desire further communication with you concerning our technology that is an over unity electromagnetic system. There exists several versions which serve as proof of concept that are in our possession. A lab model has been developed for experimentation purposes but we have not done any prototypes.

I am interested in your Z-power \$1,000,000.00 funding arrangement, where the inventors and technologies will be supported and funded by SEAS based on the merits of the technology. Our electronic technology and model does exist and can be manufactured for less than \$250.00 (Parts), but in the configuration we prefer - it does require a battery system to store the energy (which is an additional cost). The technology and models can be easily tested and evaluated with normal instrumentation in the hands of capable people. The technology could be licensed for further release on a large scale basis via a professional licensing agreement with SEAS.

This technology is owned by a corporate structure, consisting of previous individuals who have funded the research and development. We are all very cautious and somewhat gun shy of investors and developers who have tied us up legally, and failed to deliver on their great expectations and promises. In the overall perspective they have done more harm than good, but I feel certain that the right partnering arrangement could make things right. Our somewhat cautious and perhaps negative attitude at the present time is reflected in a trite statement of "show me the money". Past experience with investors assures us that you no doubt have many capabilities in protecting, developing, and working with governmental, institutional, political, security, financial, networking, media and other needed elements. This however, means little unless there is integrity on each side of the agreement and the funds to back it up.

We are aware of many of the people, articles and books mentioned on your web-site. However, what peaks our interest most is the minimum of \$1 million in licensing and royalties to the energy system that meets your criteria, which I believe we can meet in all but one aspect. That aspect is, I do not believe I can get an initial concurrence of our scientists and other interested individuals to travel to the Washington DC area, at our expense, to have the device initially evaluated by your team. It would be less risk on our part (not on yours) and less expensive for you and your team to initially come to us here in the West.

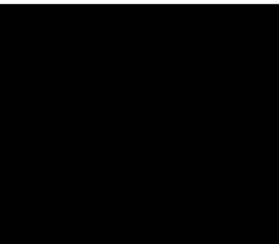

Our technology is a zero point energy (or over unity) device that produces more electrical wattage than it consumes. It is a non-polluting electromagnetic system and can be easily adapted to residential, commercial and automobile usage. Our scientists have developed this technology over a period of 15 plus years. We thus have many years and dollars invested but we do need help! Particularly, in getting prototypes developed for specific applications of energy usage but additionally, the technology needs further research and development in other applications such as communications and defense. We also have individuals and companies that we would like to involve in the manufacturing process and perhaps the marketing.

I hope to hear from you at your earliest convenience.

Regards,

Ph. D.

Proof + Concepts - Devices
→ 40-100 wt. - 4 KW -
Batteries step charged & charge
can use dead Batteries.

Inputs -
- work in national labs - Eval. conversions -
- Ben with 3 Scientists
6 sensors for 5
6 size of Computer
monitor - Electric
Capacitors - no
moving Parts - 40-100 wt Light Bulbs - Oxygen
end. Also one rotating Disc
1 Battery → series of Batteries
run a load - 400 Amp Kw
