Steve –

There is a strong “allele variant mismatch”... which is gene speak for saying they are not the same specimen. I am going to dig into it very deeply because at the least I’ve sunk a lot of time into the problem, and \$\$\$. Plus, I owe it to everyone.

I am looking into it myself. Suffice to say this is not supposed to... and rarely if ever... happens. It’s as if someone got into the files and “switched” the sequences out for someone else’s results.

Basically, the baby got switched in the basinet.

Thanks for the update 

I cannot say that I am surprised. Always some strange events in this business...

Do you know if the second run is more or less matching than the first? Or is it completely and obviously off-base?

Looking forward to the C-dating results and next run! Thank you for keeping at it...Best,

Steve

Steve,

All is well. Yes—I think I've seen that picture before.

Sorry for delay—usual overload. And partly your email came at a rather strange turn of events. I got the second sequence back for Ata—the one that I had sent to an outside company for sequencing confirmation of the first set of results. Now I am sure your paranoia radar is usually set on “peg the meter”, but I had an independent comparison done of the two genomes (the one I did before the movie versus the more complete, independent sequencing done on the last batch).

Bottom line: The sequences are not the same. But the DNA was from the same “batch”. My strong belief is that the sequence I received for the second iteration is wrong and someone accidentally misplaced the vials with another person's sequence. I've started to raise a little bit of holy hell about it. Either someone made a mistake in chain of custody for the second sequence or somebody deliberately interfered. Were the sample not the subject matter we all find interesting I would simply call it a “mistake”. I have no firm conclusion. But of course now I have to question everything.

That said I have no reason to think the first sequence was tampered with. It had a chain of custody I know and trust and no information about it where it was to be sequenced was telegraphed by email. All word of mouth. The second sample I let down my guard thinking no one would bother any more.... I still have half the sample (and a promise of a friend to do the damn carbon dating that I have to pressure him on). I am going to redo the redo of the sample and not the sample out of my sight.

Again, I am not saying any skullduggery occurred. Just saying something happened once the DNA left my possession.

No need obviously please to telegraph this hither and yon, keep it to yourself. Another replication is in progress.

But in the spirit of letting you know where things are I wanted to let you know.

Olmec figure

Dr. Greer,

This carved figurine on the right is c. 500BC Olmec and thought to represent the duality of life & death...

I see a similarity of the skeletal structure to the Atacama humanoid & Attaboy skeletons, and wonder if this carving might have been created instead to record the physical form of something that may have been living back then. (Hopefully you can see the attachment comparison photo.)

Thanks,
