Not sure if this would be helpful.
Just glanced at it.

Subject: post-mortem mutations in ancient DNA seem sufficient to explain the Chile mummy data
To: [REDACTED]

Dear Sirius, there are usually many mutations in ancient DNA due to oxidative damage after death.

Even 100-year-old bones can show 1 mutation every 200-300 bp, or several mutations within a protein-coding region.

This is all Dr. Greer needs to raise serious problems with the [REDACTED] *enome Research* paper 2018.

Most/all of the mutations which they say “gave the mummy deformed bones” could be due to oxidative damage of the DNA after the mummy died. Not while the mummy was alive.

Real reason in DNA for altered bodily structure still unknown.

Primary data from [REDACTED] not trustworthy, would have to be re-sequenced from a new sample.

Best wishes and good luck, [REDACTED] in Sydney (don't mention my name please)

Best regards,
