Good morning, Steve. Great to speak with you yesterday.

As you likely detected, I am SUPER-UNHAPPY about corruption in academic science. I have spent my career working in it and around it and I see the BS cronyism as plain as the nose on your face. In some institutions, like the NHGRI or the UK's NHS, I have seen pure criminality. In some ways, what Nolan did pains me more; it was corruption of moral fiber. Hey- I'm not perfect, I have great flaws and weaknesses, great failings of my own... ..nevertheless, of his own free will, he accepted the responsibility of the Atacama specimen and asked you to trust him with it. Fundamentally, Garry started the work from the wrong intellectual position. Moreover, he did not use best available tools and methods to execute the work (which totally baffles me).

If you ever intend to have sequencing work performed again, I invite you to contact me in advance. I would like to help you define the fundamental scientific questions and the approach used to answer those questions. I may also be able to offer insight about who should perform the work. At the very least, an additional, independent, informed opinion may be helpful to you as decision support.

I realize that I threw a lot of rather esoteric sequencing jargon at you yesterday. I appreciate your patience and kindness. At the very least, I will send you a follow-up that lays out (and hopefully clarifies) my thoughts.

Best,

[REDACTED]
