

Integrity Research Institute

January 23, 2003

Dear Steven,

Here is a revised *Proposal for the Hartman Project* that we discussed. I have been looking for a good reason to build this full-scale version for about a year now. Two other (Ivan Kruglak and Terry Rudd) benefactors have already committed to split the funding three-ways with a \$1000 donation each.

Note that the plan calls for all four purposes or goals to be fulfilled with the proposed budget. Each ramp will be individually adjusted for the maximum propulsion force and magnetic gradient. Four different magnet styles and strengths will be tested, all with the NdFeB increased level of power, as compared with Hartman's AlNiCo magnetic resources. Multiple ramps will be linked to maximize the kinetic energy gained by designing the optimum descending track as well. The connection of all six ramps will be in a circle, with small lights blinking as the ball passes by individual pickup coils. The steel ball bearing(s) that will be used accumulate a residual magnetic field as well as an induced magnetic field. Both fields contribute to the induction coil response that trigger the lights.

The closed circular track is proposed to be about 3 feet in diameter overall. It will be constructed to be securely attached to a flat platform for easy transportation and exhibition. It is understood that the funding group reviewing this project will gain ownership of this demonstration Hartman Project device assembly.

An exciting and interesting follow-up possibility is that with any magnet-powered machine, once a particular model is proven to work, everything can be scaled up for a more robust version. This is certainly the case with the Hartman Project. It is anticipated that the next evolutionary step may involve replacing the ball with a small, magnetic four-wheel cart, as with a particular Johnson patent. From that stage, which I believe is fully possible, commercial applications can then be visualized.

Sincerely,

Member
