*Black ops
Device*

don't hold your breath on this one...

Tom,

I have family in Atlanta and can stay there on standby for a day or two if it's possible to pin down within a couple days when the unit would be ready for pickup. That way, one phone call and a pickup time of two hours or less would be possible.

Best regards, [REDACTED]

Thanks [REDACTED]

Immensely appreciated.

VERY CLOSE HOLD.

I'm really sweating this one out. He has the device now working on the bench, but needs to enfold it into the demonstrator configuration. Also, he increased the power output, so has to tinker again with his transistors and their switching. That is the ticklish part of the device.

Anyway, he stated "three more days" (I usually double that estimate; tinkering with the special transistors functioning and switching is very dicey). His backers (quite mysterious, keeping everything totally quiet), have moved the inventor to a new and unrevealed location in Georgia, etc. and instituted stringent security measures. They are only going to allow one demonstrator to be let out to us. They also insist the inventor's name not be revealed; and that the demonstrator just be presented as an invention of a private inventor who does not wish his identity given.

The suppression last time (a few months ago) was very harsh and was from the highest level in the U.S. Intelligence community. Enough said. I suspect his backers now may even be one of the off-budget black ops groups that in theory "do not exist". I do know there's a dispute going on in that community between the "bad guys" and the "good guys"; and that the good guys are determined not to see the U.S. rammed down the toilet.

Indeed, if EFTV is ever to be gotten out to public use, it may be that it can only be done with the active though unrevealed participation of the "good guys" portion of black ops anyway..

Will let you know immediately as soon as the demonstrator is ready and I can get a "pickup point, time, etc." to you.

As I say, I'm really sweating on this one and I have all my fingers crossed. He built a small one of these things years ago, and I know he can indeed do it because I saw it work. I also know the special transistor is capable of doing it, because it accomplishes precursor engineering – the direct engineering of local spacetime (to build the proper forceless field's dynamics and structuring of spacetime/vacuum itself) and then interacting that now-specially-active spacetime with circuit charges to produce the necessary "EM force engines" on those circuit charges. Since the fundamental precursor engineering is force-free, it is also work-free since there is no translation of forces in the primary workup because there are not yet any forces to translate. The *forces and working* only arise in the "conventional part" of the circuitry once the force-free precursor engine interacts with the electrons and charges in the circuit to produce the necessary ongoing EM force fields required to do the work (power the load, burn the lights, etc.)

This "precursor engineering" is a type of engineering that leaps a hundred years into the future. Unfortunately the Soviets got onto it shortly after WW II, and unleashed a successful and giant effort to generate their secret weapons science of "energetics".

Best wishes,

Hi 

Looks like we'll break adv energy techs into mainstream consciousness on your watch.

I can be there within 24 hours from the time of receipt for pickup/transport to a location of  Steve's choosing to begin the demo/validation process.

 and I will be at AEPC 2008 this weekend to discuss all options - I am following his/Steve's lead by choice to ensure continuity of operations/execution.
