Excellent news.

[REDACTED] as received reliable news from the High Cabal that they are starting to get scared about the whole economic system collapsing if the scalar weapons are used unrestrainedly so they are grudgingly going to allow a few Overunity systems to appear on the market so that their cash cow does not get destroyed. Initially indications are that the units must be manufactured in a country separate from where they are marketed.

A truce on the psychotronic and Mental Master attacks on individuals was called by the H.C., but some of their entourages promptly broke it - the feeling is that the H.C. are having a bit of a hard time controlling their entourages, who like things just the way they are. However the feeling is that the H.C. are indeed genuine in their decisions to call a truce on the warfare, and to allow a few units to bleed into the markets.

(The foregoing has incidentally been confirmed to me by another individual in touch with the H.C.).

So the timing might be just right for your unit - fingers crossed!

Love to all

PS Did you get a copy of the photo of the UFO I took in Australia? We had a fab time Down Under.

Close Hold:

Heads up: the device we saw 2 years ago, which was intercepted by corrupt interests in Montreal, is now within sight. The inventor is here with us in a secure setting under 24 hour armed guard building the system. It may be completed this week - most likely will. Once it is, we will need 8 digit funding and a major strategic network for security and roll out actuated.

It will be immediately tested by ind. engineers of high calibre and will be reproduced by SEAS independent of the inventor to demonstrate SEAS internal capabilities to practice the technology.

We will quickly be entertaining sub-license arrangements and other plans to secure funding and alliances for applications, etc.

FYI and heads up. Lets hope this guy actually can get it completed. From what I have seen, it looks like the real deal (saw ONE 9v transistor battery (1 w output) turning the motor over at a steady rate - impossible given the power in that 9v!).

More later.
Steve
