

Natural Energy Generation and Water & Air Purification

Working with the great and natural constructive potential of whirling flows and motions that nature provides for us, ATDG has tapped this unlimited potential to produce clean and environmentally-harmonious Electrical Energy Generation. ATDG's Power Generation Designs produce energy without the need for destructive and polluting combustion such as fuel oils, gasoline, butane, propane, etc., or degenerative radioactive nuclear-based power plants. Our designs have been given to us through spiritual inspiration in order to heal Mother Earth.

In addition, we are protecting and preserving our precious ozone layer by designing equivalent air conditioning systems which do not depend on freon, fluorocarbons, and other harmful contaminants in order to provide efficient and clean Advanced Cooling Systems for residential, commercial, and industrial uses which provides a better quality of life for all people of our Mother Earth.

Also based on natural and harmonious principles, ATDG's concern for our Mother Earth's lakes and rivers is evidenced by our Water Purification System Designs. ATDG has a very new and ultra-advanced technology which can purify our lakes and streams as well as desalinate sea-water at extremely high speeds and volumes as compared with any system and technology presently in use anywhere in the world. Our Systems can not only significantly reduce the pollution of our rivers and lakes, etc., they can provide pure water for all of the world's needs. The requirement for pure water is becoming more critical worldwide and this is a strong motivational factor as we enter the New Millennium. These advanced systems and technologies are simple, natural, and very cost-effective to implement. At the same time as providing pure water, the energy requirements to do so are about 80% less compared with all other conventional systems of desalinization due to the energy production capabilities of our advanced systems and technologies.

Another variation of our systems can very significantly reduce air pollution from both automobiles and factories. These are vital factors to life in the next century. Volumes of pure water which can be inexpensively produced by the desalinization of sea-water at extremely high speeds and volumes shall greatly contribute to the world's agricultural industries. Our advanced systems and technologies can be implemented cost-effectively in cities throughout the world.

ATDG's Electrical Power Generators can also be built small enough (about the size of a hot water heater) to provide more than enough Power for individual homes and farms. Other Advanced Systems, designed by ATDG to replace internal combustion and diesel engines, can power marine vessels, aircraft, cars, tractors and other farm machinery, etc., at a fraction of their current fuel costs while providing greater power outputs.
