Re: Re. New Energy

Hi, Steve

Here are a couple more that you may be interested in.

Dr. Shiuj Intomata: JPI - I & JPI - II, N - machines. (Brian may have told you about him.)
Electrotechnical Lab
[REDACTED]

The N - machines are cryogenic superconductor magnetic rotating disks, that tap into the Zero Point Energy Field, having over unity output. I can send you a copy of his IANS, NES presentation on his n - machines. I also have a video of his presentation.

Alan P. Ames (ALCON Levitation Technology)
CEO
Advanced Scientific Applications
[REDACTED]

This tech. doesn't appear to be over unity. However, it doesn't require cryogenic superconductor rotating disks for magnetic levitation. Very, cost effective for magnetic levitated trains, etc. Has cross over application possibilities. I have a video of this presentation.

Here are two more men who are involved in the new energy field, who you may want to contact, one of whom I know you have heard of:

[REDACTED]

[REDACTED] 9

[REDACTED]

Research Fellow, Center for Electromagnetics Research
[REDACTED]

[REDACTED] gave a presentation on Capillary Cold Fusion, (research done by the Germans in the late 60's) He stated that power plants can be built at 25% of coal or oil plant cost with as much as, or more output, the fuel rod of the reactor are nickel, (like in the Patterson Power Cell, at CETI) with no neutron emissions.

The reactor uses light water, salt water can also be used. If sea water is used the only residue from electricity production are fresh water and sea salt. After the nickel fuel rods have been spent they are not radioactive. The nickel becomes brittle in lab experiments (ionic oxidation?).

I suggested that tunned acoustic sound waves be used to help prevent this condition. I also have his video with my input.

I think we can bring a good team together with this and the previously transmitted information.

[REDACTED]

P.S. I just got a call from [REDACTED] he was in Crestone this summer, saying that Art Bell retired and his show is off the air. Will this hurt us?
