SUBJECT: Aerial Phenomena

Commanding Officer
AF Cambridge Research Laboratory
Attn: Base Directorate, Geophysical Research
230 Albany St.,
Cambridge, Massachusetts

1. Per request of Dr. A. O. Mirarchi, during recent visit this base, the following information is submitted.
2. Sightings were made on 27 April and 24 May 1950 of aerial phenomena during morning daylight hours at this station. Sightings were made by Lang-Air, Inc., personnel while engaged in tracking regular projects with Askania Photo-sodolites. It has been reported that objects are sighted some number; as many as eight have been visible at one time. Individuals making these sightings are professional observers before I would rate their reliability superior. In both cases photos were taken with Askanias.
3. The Holloman AF Base Data Reduction Unit analyzed the April pictures and made a report, a copy of which I am enclosing with the film for your information. It was believed at triangulation could be effected from pictures taken on May because pictures were taken from two stations. The films were rapidly processed and examined by Data Reduction. However, it was determined that sightings were made on two different objects and triangulation could not be effected. A report from Data Reduction and the films from the sighting are enclosed.

4. There is nothing further to report at this time.

Incls:

- Incl #1-Data Red Rpt #1
- Incl #2-Data Red Report #2
- Incl #3-Film, P-10, 24 May 50
- Film, P-3, 24 May 50
- Film, P-10, 27 Apr 50
- Incl #4-Map of HFB Range

Objects observed following MX 776A test of 27 April 1950

2nd Lt

EHOSIR

15 May 50

1

1. According to conversation between Col. Baynes and Capt. Bryant, the following information is submitted directly to Lt. Albert.

2. Film from station P10 was read, resulting in azimuth and elevation angles being recorded on four objects. In addition, size of image on film was recorded.

3. From this information, together with a single azimuth angle from station M7, the following conclusions were drawn:

- The objects were at an altitude of approximately 150,000 feet.
- The objects were over the Holloman range between the base and Tularosa Peak.
- The objects were approximately 30 feet in diameter.
- The objects were traveling at an undeterminable, yet high speed.

he other two movies were made at the White Sands Proving Grounds with Ansala Cine theodolites—scientific tracking instruments for following guided missiles. The first was made April 27, 1950. Shortly after a missile was fired and had not yet entered the atmosphere and fallen, someone spotted an object in the sky. The theodolites were braked up by an antenna system, and several stations were instructed to try get pictures. Unfortunately only one camera had film. The camera showed a blurry, dark object, not very well defined, and moving.
