

Loops with one end open should be used around plants to help remove negative energy that builds up in plants. I have found that a loop with one end in the soil and the other end with a needle on this end pointing toward the sky will help discharge the negative energy in the soil.

The chinese cabbages in our green house always have aphids on them but none on the lettuce. December, january and february all of the chinese cabbages were dead from aphid attack within 40 to 60 days. They are started in the basement for the first 30 days where there are no aphids. Therefore the aphids will kill the plants in usually less than 30 days after setting out in the green house.

First we made a loop with three coils to it. We will call this Loop A. Since this was too difficult to use on 200 plants^{and} it would take too long to make them. We next tried a loop using wire twice the thickness with only one coil to it. Loop B when tested had about $\frac{1}{2}$ the aura around the inside compared to Loop A. We put a No. 7 sharp sewing needle on the end pointing toward the sky. Now the single loop B had twice the aura in the center as compared to loop A. The wire for the single loop B was made of #12 gage enamel copper wire. Loop B I tied the ends to gether figuring the enamel would keep them separate.

I used six plants 3 different types of chinese cabbage. two loop A and one loop B was used. After 20 days hundreds of aphids were on the controls.

One loop A had no aphids any were on the plant the other two had 5 or 6 aphids per plant. On the controls the centers had the most aphids and some on the underside of the leaves. The Looped plants did not have any aphids in the center. After 40 days Both loop A had there plants covered with aphids. Almost none were on loop B plant.

As we moved into march even plants that were ~~only~~ in the green 10 days had a lot of aphids on them a few chinese cabbages were left with out loops they are almost dead already. Almost all the lettuce are still free from aphids Which is the best I have ever seen this time of year. I should state here that no sprays of any kind are used, the plants have never been washed free of aphids this year, and no repellants are being used. The green house is connected by 25 foot tubes which are used to exchange air. When the temperature is over 70°F it acts as a solar collector The house acts as the large heat collector and gives back the heat at night. Because of this exchange the cost of heating the green house was nothing. The blower going into the green house comes from the kitchen, therefore all the cooking orders and chemical used in the house, such as ammonia, cleaners, chlorine, paints, etc. enter the green house and have a very bad effect on all the plants.

The loops still did not preform as well as we expected. First the aura around the pot or root area was blue to white and the top was the same. the root we feel should have given off a pink or redish light(aura).

I thought of Lakhovsky his loops always had gaps in them and in the past so did most of mine. The question is what size of a gap is best.

Back in 1975 I was working on PSI generators and had many working models. While working in this area We found a good picture of a PSI generator made in Russia. I measured the circumference around the cylindar and the gap that was let in the cylindar. We then tried to find a relationship between the circumference and the gap. Allthough our measurments could have been off we intuitivly chose pi as the radius. Circumference = Diameter x pi. If the Diameter = 2 x the radius $C = 2r\pi$ and $r = \pi$ then $C = 2\pi^2$.

$\pi = 3.141592654$ $\pi^2 = 9.869604401$ times 2 = 19.7392088.

We now chose the gap as the fraction .7392088 and the material that the loop was made of as the whole number 19.

$\frac{.7392088}{19.7392088} = .037448755$ my intuition said that we should repeat the first three numbers of the ratio. For 10 years we have not been able to fine any important relationship to any natural or other thing so until to day March 9, 1985 the idea just sat still. Today everything came to light.

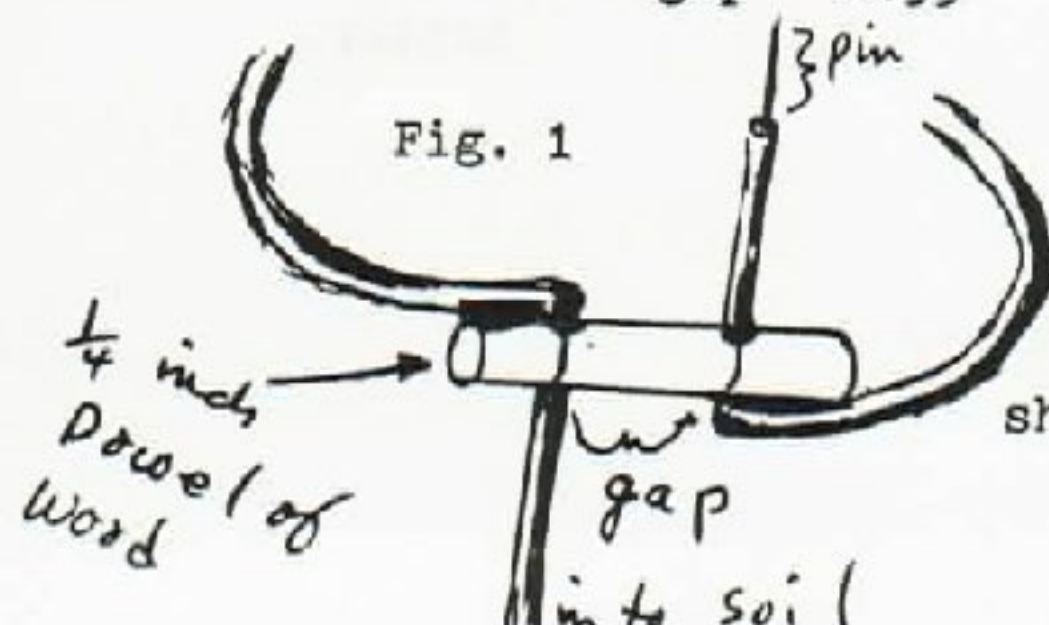

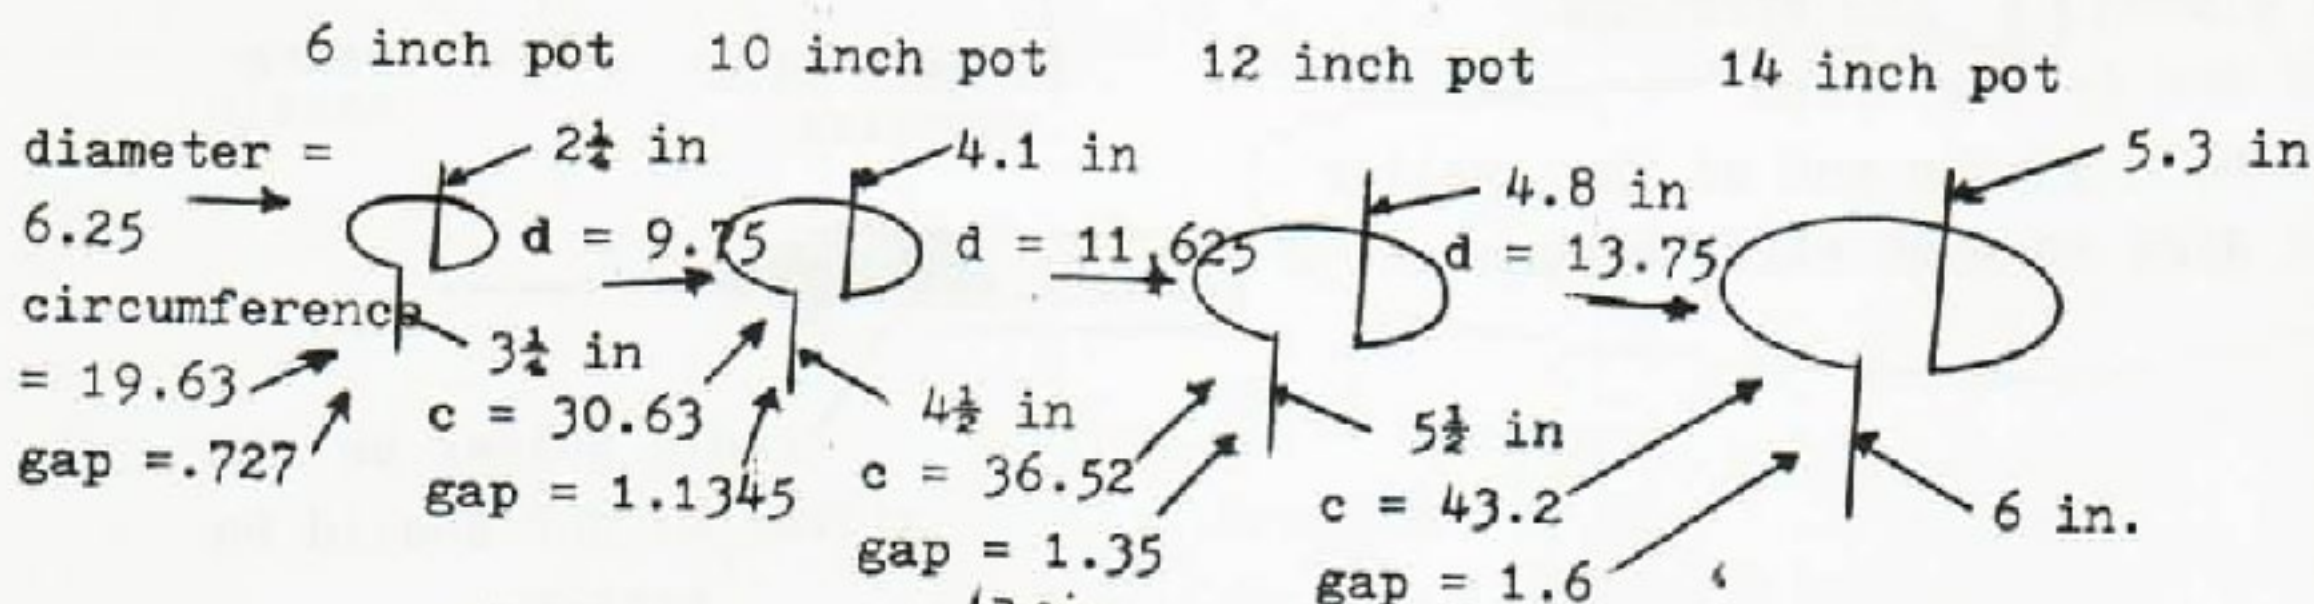

Before this year I used numbers from the octive group 2,4,8, the spirtual, group 5,10,15, and phi number group 1,2,3,5,8,13 21, and its peak numbers on its wave 1,2,4,7,12,20,33,54..

This year I was told to use 9,6,3 series or trinity numbers, the .037 when subtracted from 1 = .963 $1 - .037 = .963$ but this is not all that happened I repeated the first three numbers .037037037037037037 and this = $1/27$ or $1/27 = .037037037037$ try it with your calculator. 3 cubed = 27 trinity raised to trinity.

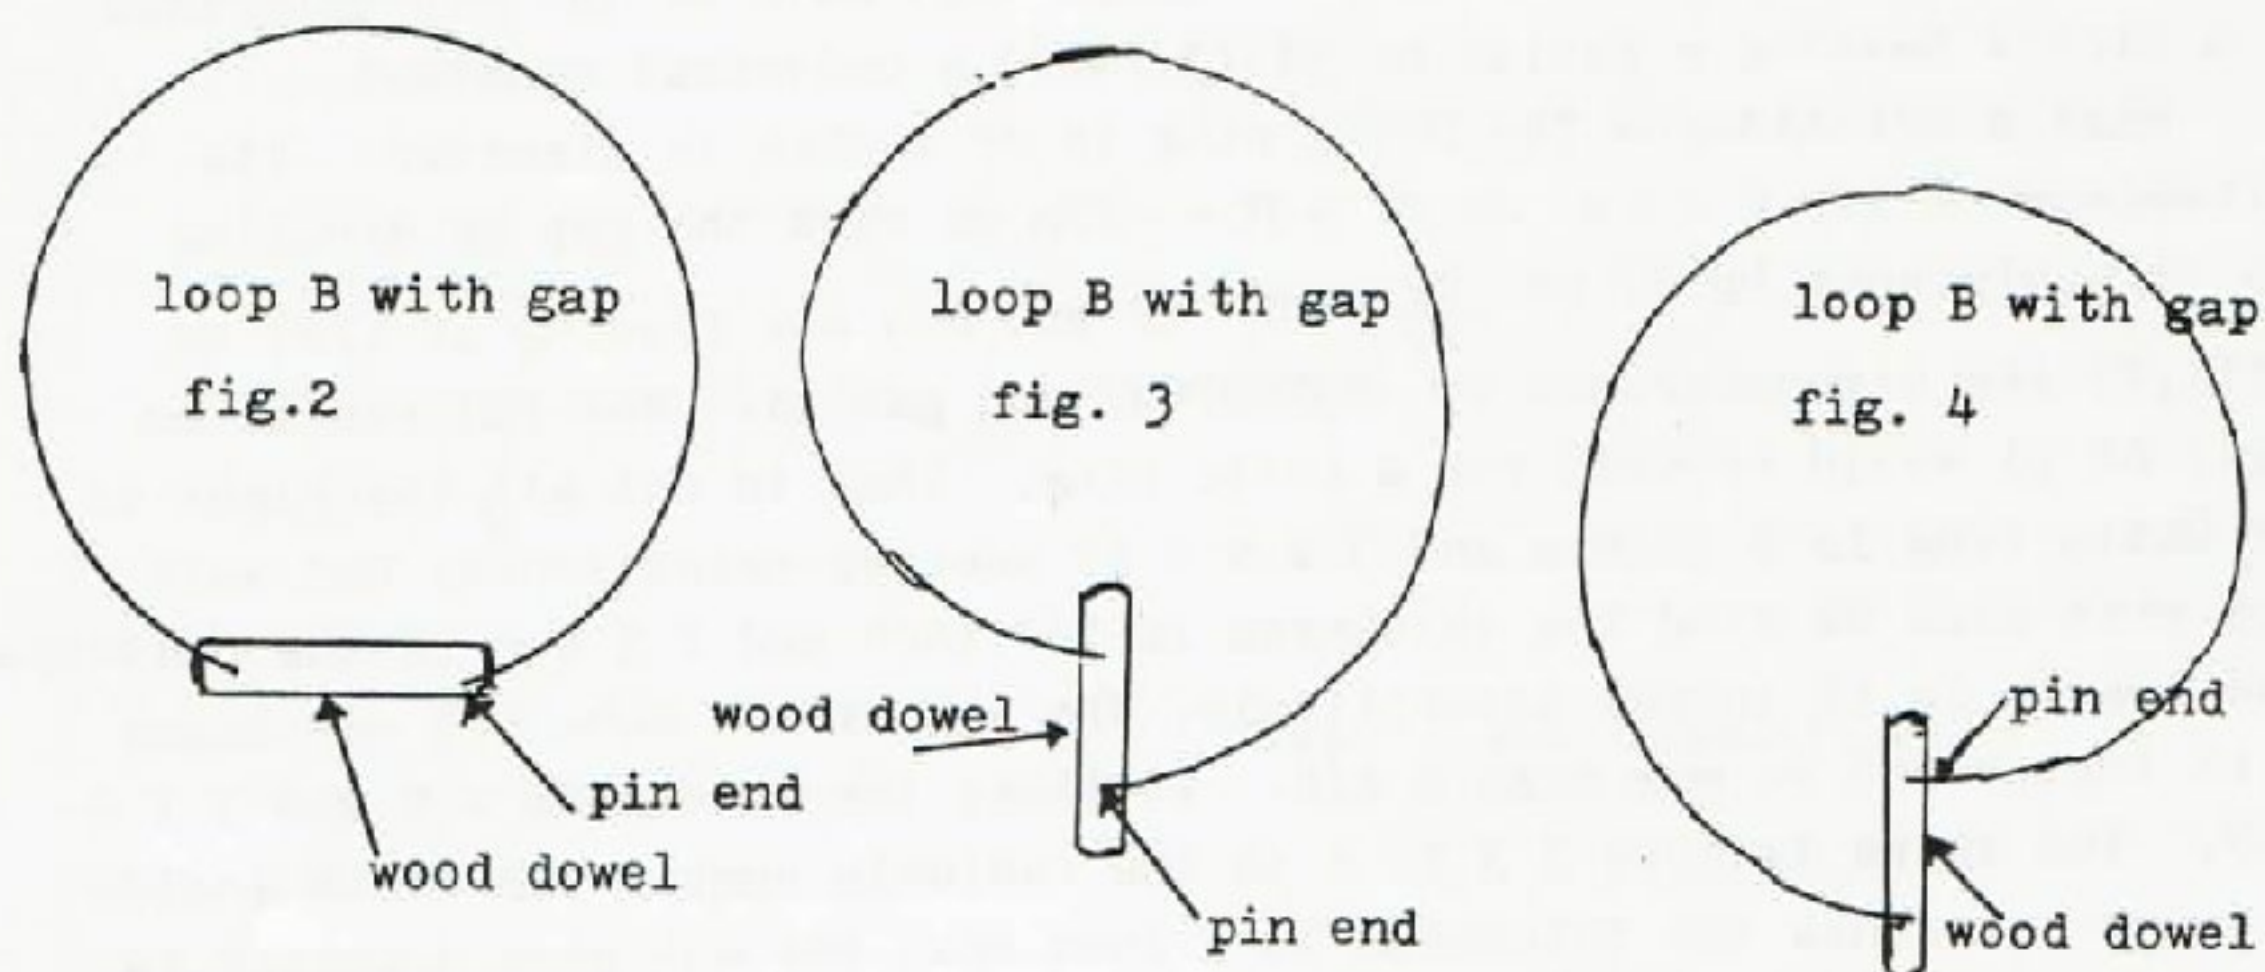

Therefore $1/27$ of the circumference is the gap size. which we orginally got from using the fraction of the number that gave us the circumference of a circle haveing a radius of π . (3.1416) a universal constant.

What a coincidence The Dotto ring is 27 inches in diameter. its circumference is $C = \pi D$ or $27 \times \pi = 27\pi$ we find the gap by dividing the circumference by 27 or $\frac{27\pi}{27} = \pi$ If you use our finding of $1/27$ or multiply the circumference by .037037037 you get π . For PSI radiation a gap of π would be used for a Dotto ring. That is not all, the hight of the Dotto ring is 9 inches and $3 \times 9 = 27$ another coincidence, but wait look what else we find the thickness is $1/2$ inch and $2 \times 9 = 18$ the universal wave length is 18 inches scientifically. The ark of the covenant was based on 18 inches and so was Noah's Ark. 18 times the thickness = 9 and $3 \times 9 = 27$. Yes there is more $2 \times 27 = 54$ the radionic number for death inside the ring and since the thickness is $\frac{1}{2}$ inch then the out side diameter is 28 for the Dotto ring and $28 \times 2 = 56$ the radionic number for life. $7 \times 8 = 56$ $6 \times 9 = 54$ Interesting isn't it. Now if we double the inside Diameter again $2 \times 54 = 108$ Oh my $108/12$ inches = 9 feet. The circumference = aprox 339.2920066 / 27 our gap is now 12.5663 or about one foot or 4π .

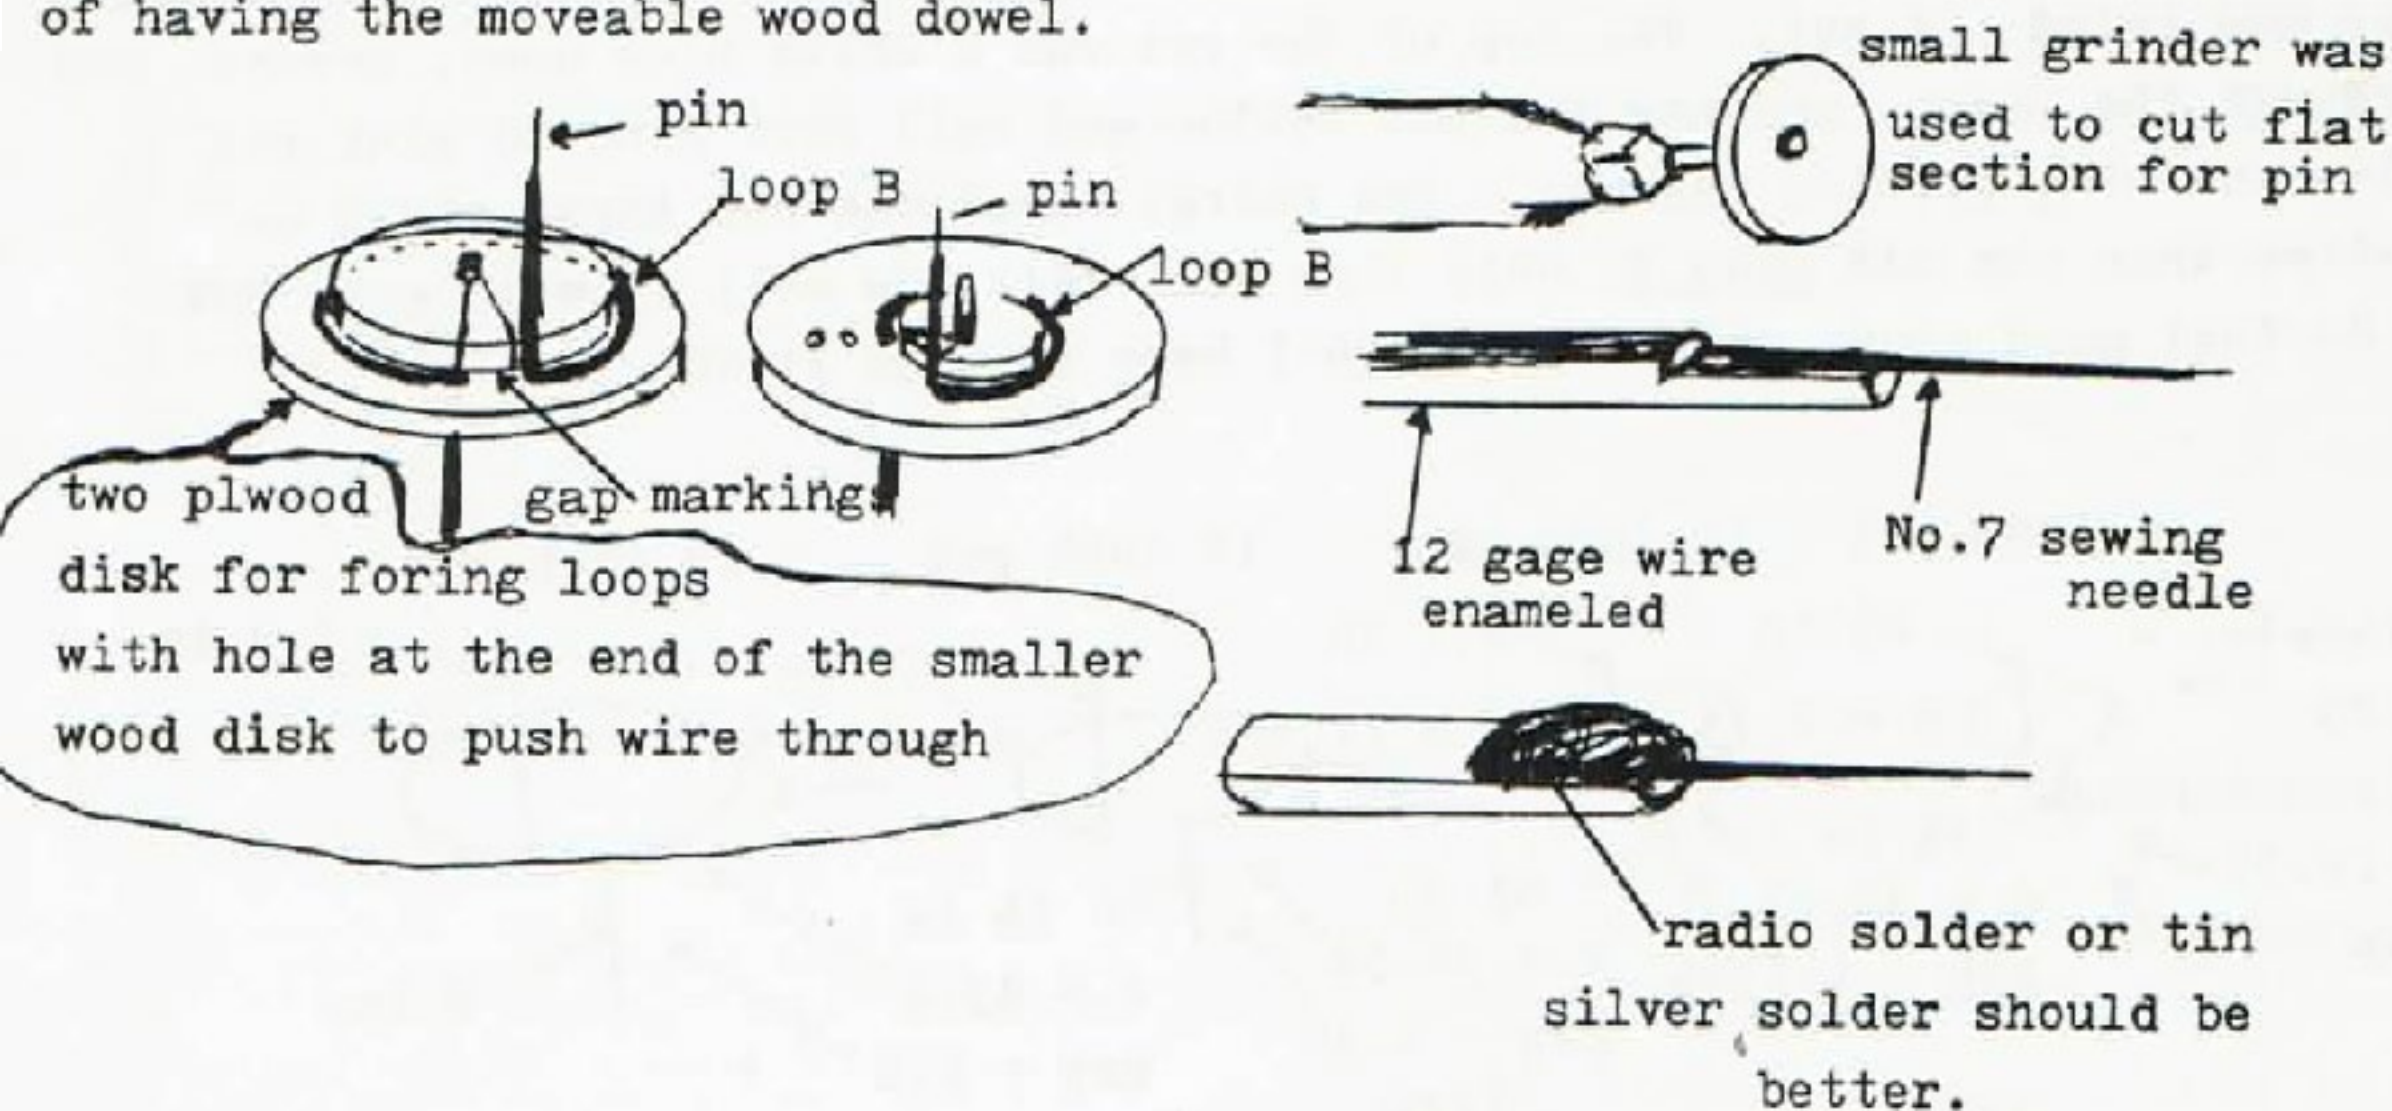

After finding all this we quickly made a loop B with a $1/27$ circumference gap and tried it out. The top of the pot was a white blue over, around, and through the plant, and now the pot bottom and soil were pink to pink red with the ring glowing magenta. The energy level was now three times or better than the old loop B. Only time will tell how well it will work but I do feel good about this finding so I have to pass it on.

We drilled a hole through $\frac{1}{4}$ inch wood dowel on both sides of the gap and inserted the loop B as shown in fig. 1

When the loop B is placed around the plant as in fig. 2 the aura is equally above the pot as below the pot. When the Loop B is as in fig. 3 the energy moves below the plant into the soil. When the loop B is as in fig. 4 the energy moves above the soil. This is a additional advantage of having the moveable wood dowel.

Earlier peak numbers 1,2,4,7,12,20,33,54 were mentioned you probably were wondering where they came from.

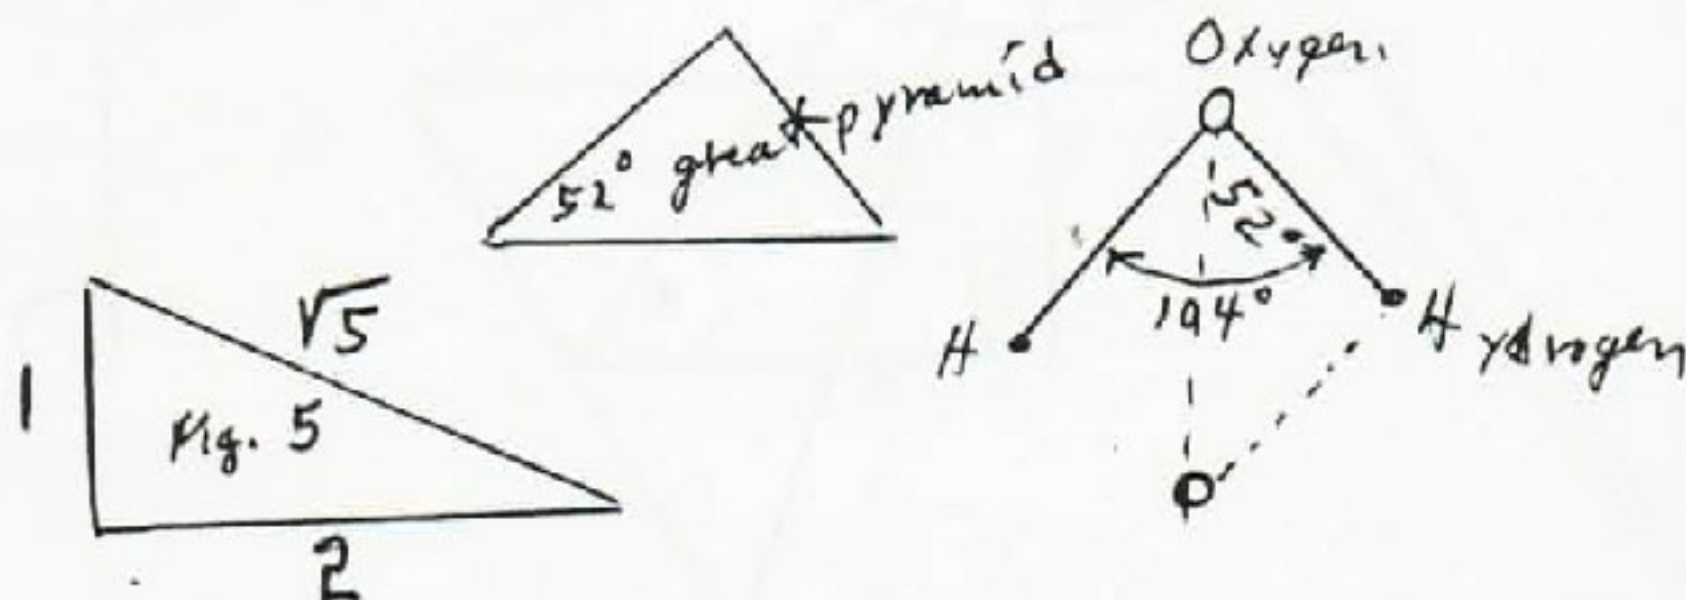

First we have to start with Fibonacci number. If we add 1 to 1 = 2 then we add 1 to 2 = 3 then 2 + 3 = 5, 3 + 5 = 8, 5 + 8 = 13, 8 + 13 = 21, 13 + 21 = 34, 21 + 34 = 55

Now if you divide each preceding number by the next in line you approach 1 + phi that is why I called the phi number.

1/2, 1/3, 2/5, 3/8, 5/13, 8/21 this approaches .618034..... phi = 1.618034... or the golden number. In the book the divine proportion by H.E. Hunley Dover 1970. He states Iris 3 petals, primrose 5 petals, ragwort 13 petals daisy 34 petals, Michaelmas daisy 55 petals, divergences for stems while growing, common grasses 1/2, sedges 1/3, apple trees 2/5, plantains 3/8, leeks 5/13.

If we take a ray and stop it at some point we have a line. the simplest thing we can do to the line is fold it in half. Now if we take this 1/2 of our original line and put it at the start of the ray 90° to it then connect the two open ends you will have a triangle fig. 5 the vertical line being 1 or 1 and the horizontal line then being 2 if the vertical is one, the diagonal will be the square root of 5 and $\phi = \frac{1+\sqrt{5}}{2}$ $\phi - 1 = \frac{1-\sqrt{5}}{2}$

On pages 6 and 7 give some relationships to Phi and the great pyramid. On page 8 you can see the relationship to 1,2,4,7,12, if you place pyramids one on top of another 1 and 2 will give you high readings but 3 will not yet 4 will again but 5 and 6 will not but 7 will 8 will also go high because 2 X 4 is 8 but 9 will drop so will 10 and 11 but 12 will be very high. What the negative equivalents of this group of numbers are I do not know. The base angle of the great pyramid is 52° and the diagonal coming from the oxygen molecule of water between the two hydrogens is also 52° I wonder if this is why water is such a good absorber of the life force. maybe this is a window. Remember water crystals form stars of David, and honeycomb tube like crystals.
