EM Brain Tap Lawsuit
Filed Against the NSA

The technology of "biophysical information transfer" is so advanced it is sometimes passed off as "alien." In a lawsuit filed against the National Security Agency in a District of Columbia federal courthouse (civil action 92-0449), a private citizen, John St. Clair Akwei, described the ultimate in electronic surveillance, Remote Neural Monitoring (RNM). This device sends coded signals to the brain's auditory cortex, communicates directly with the brain "to debilitate subjects by stimulating auditory hallucinations characteristic of paranoid schizophrenia. Without any contact with the subject, Remote Neural Monitoring can map out electrical activity from the visual cortex of a subject's brain and show images from the subject's brain to a video monitor. NSA operatives see what the surveillance subject's eyes are seeing. Visual memory can also be seen. RNM can send images direct to the visual cortex, bypassing the eyes and optic nerves. NSA operatives can use this surreptitiously to put images into a surveillance subject's brain while in REM sleep for brain programming purposes."
