

Chapter one - Pg 8

Landing on Terra Firma

Presents evidence
of the subject matter
as perceived by CSETI.
It covers some of
the history of the
phenomenon, with
individuals identified
at very high levels
of government

CHAPTER ONE

LANDING ON TERRA FIRMA:

The Best Available Evidence For Extra-Terrestrial Life Forms

[Editorial Note: We are not going to go through all the evidence here; but this is introductory remarks regarding the evidence. The evidence is too vast to present in this sort of form.]

^{Hypok}Dr. J. Allen ^{He}Heinick, an astronomer at Northwestern University and a consultant to the Air Force Project Blue Book, ^{we}after many years of looking into the question of extra-terrestrial visitations to this planet stated that, "We have an embarrassment of riches." The average person believes that the subject is either spurious or irrelevant, ^{or}or certainly lacking in any substantial evidence. This is not by accident. This is a result of 40 to 50 years of deliberate attempts to minimize the issue, ^{to}and to ridicule it, ^{prevent}and to keep ^{from}coming to the surface the definitive evidence regarding the detection of extra-terrestrial life forms. ^{he}We will present ^{in this Chapter}in this Chapter a very small tip of the iceberg of the evidence which we have collected from around the globe, [↑]supporting the fact that planet Earth is being visited by at least one, [↑]and probably several, [↑]advanced extra-terrestrial life forms, who originate from outside of this solar system.

In looking at this evidence, it is important for the reader to keep in mind that the whole is greater than the sum of its parts. For example, one of the pieces of evidence which you will see is a non-declassified CIA document ~~that is top secret~~, which describes John F. Kennedy's knowledge of the subject and his visitation to a secret air base to review the remains of bodies and debris from outer-space. It is dated August, 1962. Now, this piece of evidence, in and of itself, is a smoking gun; and it has never been presented publicly before now. However, there's an interesting corroboration for those who would be stunned by this piece of evidence to the point of doubting it. And that is the testimony of a member of John F. Kennedy's staff, an air force officer on Air Force One, Bill ^{Holden} ~~Holton~~, wherein he states that he had a conversation with John F. Kennedy about this subject, that the President knew about it; but that, ~~and I quote~~, "The matter was out of his hands, but he ~~did~~ did not know why."

The implications of this piece of evidence alone are stunning. And it is one of many. ~~And the point of that~~ ^{is} is that the totality of the evidence must be taken together. No single case will convince anyone that we are being visited by life forms from other planets. However, the weight of all of it together creates a body of knowledge and evidence which is so powerful that you either have to be in profound denial or deliberately hired to disinform the public if you do not reach the assessment that we are not

alone.

Many people are ^{Non-plussed} stunned when they learn that members of our research team have collected not 30 or 300, but over 3,000 military and civilian pilot encounters, many corroborated with radar, visual contact from the air, and visual contact from the ground. Others are stunned to learn that there are not 4 or 40 or 400, but that there are 4,000 plus landing trace cases where these objects have landed and left some sort of physical remains that have been analyzed or documented. Keep in mind that these cases would only be the smallest percentage of the actual events because there is massive under-reporting on this subject.

Others are ^{shocked} stunned to learn that there are not only one or two, but hundreds of official documents from the US government, from the KGB, and from other governments in the world describing encounters between our various military forces and these extra-terrestrial vehicles. We will present the tip of the iceberg of these documents.

And then still others are ^{astounded} stunned to learn that greats, such as Herman Ober, one of the pioneers of space travel, government leaders such as Adm. Roscoe Hillinkeater, one of the first heads of the Central Intelligence Agency, astronauts such as Gordon Cooper, and others will in these pages

give their testimony concerning their direct knowledge of this subject. The average person has no knowledge that such people have not only had encounters, but have shared their assessment of ^{these} ~~their~~ encounter and have provided testimony.

And the reader will be surprised - since it is proclaimed so often that if this is true, where is one good photograph - when they see that there is not one but dozens of daylight photographs that are crystal clear and which have been analyzed by scientists at NASA, ^g ~~at~~ Los Alamos, ^g ~~at~~ IBM, and elsewhere. These also will be provided.

And of course, since this is a book, the portrayal of movie and video tape footage is difficult. But the stills which will be presented will be but the very smallest intimation of the volume ^s which we have collected. One of our associates in Latin America has in his personal collection over 1,500 video-taped segments from the Mexican extra-terrestrial visitations from 1991 to the present. ~~1,500~~ segments. Many of them in broad daylight clearly showing flying disks with domes on them or large triangular craft manoeuvring in the sky.

Ultimately, then, the most ^{Amazing} ~~stunning~~ thing about this evidence is that it is just now being put together in a cohesive fashion and shared with the world.

I have been asked many times what is the most ^{dramatic} ~~stunning~~ thing about this whole area, ~~this whole subject~~. And what I always say is that it is not the fact that extra-terrestrial life forms are landing on terra firma, it is the fact that the majority of the world's population have not been informed of this and that the people responsible for ^{answering} ~~responding~~ have responded in the way in which they have. This is ^{overwhelming} ~~more stunning~~ and in many ways more shocking to the sensibilities of the modern person than the fact that there is life, intelligent life, from other star systems visiting our world.

~

Now, Before presenting the actual evidence, ^{we} ~~we~~ would like to go through a brief discussion of science. It is true that 90 to 95 percent of everything presented on this subject in the media, both print and electronic, books and videos, is unadulterated rubbish. Now with that said, what is interesting is that the core ^{five ten} ~~5 to 10~~ percent of the information is so excellent. Unfortunately the tendency of traditional science is to ^{throw} ~~throw~~ the baby out with the bath water; ^{which} ~~but~~ this is a very dangerous thing to do. Because every great scientific discovery has been the result of sifting through a ^{huge} ~~great~~ ^{amount} ~~deal~~ of noise to find that very coherent sound, that "A-ha!" that makes sense; and that is the task of a true scientist. The mother of all science is empirical observation, whether it is Newton watching an apple fall from a tree and hitting him on the head, or whether it is the serendipitous discovery of a new type of molecule or organism by a lay person or a student.

Empirical observation has been[^] and will always be[^] the bedrock of genuine scientific advancement. Isn't it strange, however, that notwithstanding the huge number of empirical observations from trained observers that traditional science rejects^{the fact} that we are being visited by extra-terrestrial life forms?^{reaction} I would say that this is pseudo-science and not science. And it is dangerous because of the significance of ~~this~~^{the} subject^{and} and not only its scientific implications^{concerns} but in its cultural, political, religious, and even environmental implications^{affects} to miss something this major because of prejudice[;] because of former ridicule by official agencies of our and other governments[;] or because of a reluctance to acknowledge that there may be civilizations a few steps further down the technological road than we are, borders on the criminal.

This type of pseudo-science can only be overcome by people insisting that our leaders, scientific and otherwise, take a very hard look at the evidence. A very well-known astronomer has stated, for example, "that extraordinary claims require extraordinary evidence." We will present^{at} here that extraordinary evidence which has been ~~called for~~^{demand} requested?

But in a similar vein, we ask that the scientists and the public alike maintain an open mind on this subject. Because it has been said that the mind is like a parachute, it only functions when it's open. And if the mind is closed

and dismisses out-of-hand information, observations, evidence because it does not fit one's preconceived prejudices and ideas, then great discoveries will be missed. And the Earth will be robbed of extraordinary opportunity.

All of ~~this~~ ^{the} evidence which ~~is~~ ^{which} being presented here has been available for quite some time to the public, except for some very small parts of it, albeit conclusive ones, such as the government witnesses and astronautic witnesses ^{whom} which we have recently assembled. And ~~what~~ ^{is} is fascinating is that it has been missed by the scientific press and by the public. I said earlier that this is no accident. And ⁱⁿ a later Chapter we will go in depth into how this subject has been managed covertly and for the last 40 to 50 years and what ^{the} implications of that covert process are for democracy.

But ^{it} is important at the outset to discuss how this evidence has been buried and discredited. It would be nice if it had just been a matter of oversight. But it has not been. There have been people since the forties and fifties ^{people} who have been employed for the express purpose of ridiculing, debunking and, in general, discrediting this field of knowledge. For example, the very well-known astronomer from Harvard, Donald Minsley ^{Menzel}, who wrote a number of books debunking this subject in the fifties and sixties, was found after his death and through ^{the} Freedom of Information Act

requests to have been on the payroll of covert agencies all those years, even though he publicly had denied it. He was, in fact, a paid disinformation specialist. He was also a very esteemed Harvard astronomer. The two were not mutually exclusive, nor are they mutually exclusive today. For this reason, we would warn the public to carefully weigh the denunciations ^{the} and the ridicule ^{and} and the dismissal of this evidence by the experts and authorities.

A technique for keeping valid scientific inquiry away from this field has been ridicule. It is an established fact, and CSETI possesses the documents to prove it, that there was a deliberate attempt as early as the 1953 period to make the entire subject appear silly and to discredit it. Attempts such as engaging studios to make cartoons to ridicule, to make light of, to create silly scenarios, ^{and this} ^{have} ^{since} and this has only intensified over the last 20 years. So much so, that with the closure of the Air Force Project Blue Book, which was mainly a smokescreen and public relations ploy by the Air Force on the subject, while a covert group was really doing the genuine research, that since that time, essentially, all information on this subject has been shoved into the area of the "occult," the parapsychological, and if you go to a bookstore today, you will find it under ghosts, goblins and things-that-go-bump-in-the-night.

This was not an accident. This was a result of many years of withholding scientific credibility and magnifying the most absurd, titillating, and nonsensical stories within the civilian community. By doing so, it creates a dynamic which is beyond the control of science. We might refer to this as the kindergarten factor. If you are in kindergarten, think back, what was the worst thing that could happen to you? To be ridiculed, to be laughed at, to have your self-esteem crushed by your peers ^{who} ~~by being~~ denigrated or ^{you} put down. No matter how great the scientist or how great the person, we all have that child still within us, that responds in an aversive way to that kind of ridicule. And by setting up a very large dynamic of ridicule on this subject, it has guaranteed that people who have invested a great deal ⁱⁿ and their professional careers and their scientific credentials would steer clear of it.

Our team has had numerous, too numerous to count and even recall, discussions with very respected scientists who know that this subject is real, who know that this planet ^{is} ~~is~~ being visited by advanced extra-terrestrial life forms, but they will not touch it with a ^{ten} ~~10~~-foot pole. Why? Because they would irreparably damage their reputations and their career because of the way ^{represented (or interpreted?)} ~~that~~ the subject is held by the public and by the media as silly and nonsensical and in such low esteem.

↓
presented to the public

This dynamic is an over-arching one that has dictated how ^{the} this entire matter has been discussed in this society, and to whom ^{which} the subject has, therefore, been relegated. ^{the topic has been relegated} And unfortunately ^{we} that has often been to the lowest common denominator in the public and in the civilian ^(Non-military) community. This is tragic, because there are many excellent scientists who have either had direct experiences with the subject or who have certainly looked at the data because they ^{were} are curious and have reached the conclusion that we are being visited, ^{but} who will not step forward in ^{in the} current atmosphere of silliness and ridicule, and low self-esteem that ^{surrounds} attends this subject.

I (We) cannot overstate how significantly this has impacted the scientific community. It is appalling to be with people who are bright scientists and to find that they can only whisper to each other about this subject, and that even scientists who have done research directly in the field of extra-terrestrial technology will present their research completely disconnected from the subject and present it to the public as if it was completely devised out of thin air. The history of this is very deep and very far-reaching. And ^{we} the only way to turn it around is for people, lay people and scientists together, to state emphatically that this is a subject worthy of serious investigation, research, and dialogue. ^{we} And it is hoped that this body of evidence contributes to the turning ^{on} of the atmosphere around this subject from one of disbelief and ridicule to one of serious inquiry.

I would like to return for just a moment to the concept of empirical observation. Because this becomes a critical question in terms of who science evaluates something. Many people do not know, for example, that a couple of hundred years ago meteorites were thought to be the hysterical musings of peasants and farmers and lay people. ~~That~~ ^{it} was thought utterly impossible that a rock could fall from space or from the sky and land on the ground. In fact, the scientific community in Europe stated flatly that this was nonsense and the imagination of uneducated, simple minded peasants. Of course, we now know that this is not true.

It is also shocking to learn that Werner Von Braun, who is one of the most important pioneers in space travel, stated in 1949 that we could never go from the Earth to the moon. Never. That it was a physical impossibility, because the payload required and the amount of fuel required to get to the moon was so great that the gravitational pull of the Earth would prohibit any such vehicle from escaping Earth's gravitational pull and, therefore, would never reach the moon. Well, 20 years later Neil Armstrong was taking that giant leap for mankind.

I give these examples only to show that scientists and experts are notorious for having prejudices and fixed views on things that keep them from seeing

the potential of what will be. ~~And~~ ^{in which} in this regard there are two types of scientists. There are those who maintain the status quo and who add very small increments to the field that they are working in, and this would be the vast majority of people ^{employed} working in scientific endeavors. And then there are scientists, the Newtons, the ~~Galleios~~ ^{Galileos}, the Einsteins, who look at the world in a different way and make a quantum leap from current knowledge into the pioneering fringes of knowledge ^{to} and establish an entirely new field.

Now, the orthodoxy of science ~~is such that~~ ^{those who maintain} and the training of most scientists ~~is such that~~ it encourages and rewards the maintainers of the status quo. ^{due} And whether it is the field of medicine, or physics, or astrophysics, or chemistry, we find over and over again scientists who make new breakthroughs end up being stung, as it were; because they have presented new information which does not fit the current ~~paragon and the~~ ^{paradigm} ~~current~~ framework of understanding. What greater shock to the scientific ~~paragon~~ than to state that there are extra-terrestrial life forms advanced enough to travel through interstellar space, and go from their corner of the Universe to ours. ^{And when} And when the evidence is ^{examined} ~~looked at~~ more deeply, to discover that these vehicles are traveling ^{stretch} ~~at~~ faster than the speed of light (which is, of course, impossible according to the Einstein General Theory of Relativity). Or to ~~stress~~ the envelope one step further, to discover through empirical observation, if not through a mechanistic understanding,

that there is an interface between what we call thought or mind and these machines and their control mechanisms; And that this interface between thought and computer is as efficient as twentieth-century people picking up the phone and talking to someone through satellite dishes in another country.

These are stunning discoveries. And so there is a certain amount of scientific indigestion which is attending this entire question. For that reason, there has been an inherent aversion to the subject, which extends to the current time. It would be useful to share one anecdote regarding this.

In 1993 I was asked to give a keynote address at Cambridge University in England to the MENSA Society, which is a group of people who claim to have very high IQ's. And at the end of the presentation, wherein I presented a fair amount of evidence and assessment on this question, an elderly gentleman I estimate to be in his 70's got up and with great fury said, "I find it utterly depressing that a man of your intelligence would be wasting his life on such drivel." To which I replied, "Well, I beg to differ. Because if everything we are presenting constitutes only a 10 percent probability that we have detected extra-terrestrial life forms visiting this planet, this is one of the most significant discoveries and

acknowledgements in the history of the human race. And we dare not ignore this data." He became more agitated and said, "I'll have you know," with great British flair and fervor, "that I am a very respected British scientist and have worked on many government committees. And if any of this were true, I would have known about it."

And this revealed an interesting dynamic. How can scientists who regard themselves ^{at} the pinnacle of all knowledge ^{not} recognize that we are really one-half of one step out of the jungle from a technological or civilization point of view. Or that all of this could be going on around us, controlled very tightly through a covert operation and that they wouldn't know about it. This, again, has nothing to do with scientific rules of evidence. It has to do with the psyche of the human being. And the psyche, in particular, of scientists, experts, and authorities.

Later, two friends of this scientist came up to me after the lecture at Cambridge University and said, "I hope you weren't offended by our friend." And I said, "Oh, not at all. I have been called everything in the book. Nothing shakes me too much at this point." And they said, "Well, he was actually frightened, and that's why he reacted this way." I said, "Really? I didn't mean to portray the extra-terrestrials as malevolent or hostile at all, because I am quite certain they are not." And they said, "Oh, no. He

wasn't frightened by the information; but he was frightened that it could be true. And his entire paradigm of reality and his whole understanding of cosmology and of science and of physics would be swept away as virtually irrelevant in light of this being true. And this shook him to his foundation."

give And this was a very instructive moment, because what it indicated was that the resistance to new fields of knowledge has almost nothing to do with science and evidence; it has much more to do with the attachment to the way things are or to the way things were. *with* And the sort of chauvinistic identification of an individual's ego and self esteem with a certain knowledge base or a certain fund of knowledge, *so* that when something like this comes along, it becomes not just an intellectual challenge, but it *is* almost *comes* as an assault or a challenge to that person's entire identity *and* it therefore precipitates a scientific identity crisis. And that, indeed, is what we are dealing with.

In a later Chapter, we will discuss the implications for science and technology of this subject. But we will just state here that the implications are so vast and so far reaching that no aspect of life on Earth will be untouched by it by this *date* time in the next century. *give* And that is how important the subject is.

I would like to comment for just a moment on the effort that went into assembling this evidence. The reader will note that it is called, "The Best Available Evidence." Available being the operative word. ^b Because the best evidence is held by various covert control groups; and by this I mean dead extra-terrestrial bodies, tissue samples, ^{what kind of material?} material, hardware, and entire, intact extra-terrestrial spacecraft. We know these exist; we have excellent first-hand testimony to this from multiple corroborating sources. But as of this date, we are unable to haul out ^{present} for you an intact ET craft or a fully autopsied extra-terrestrial entity.

^{However,} But the evidence will show that, indeed, they exist and have existed in the hands of certain special access operations of our government for decades. But without this conclusive proof, do not make the mistake that some very clear conclusion can ^{not} be made. Again, the whole is greater than the sum of the parts. And the amount of evidence which has been assimilated is overwhelming in its support of the fact that we are being visited by interplanetary spacecraft.

It is sad that the rules of evidence tend to get changed so often. Anyone who knows anything about modern astrophysics or quantum mechanics will know that the vast majority of the evidence is inferred evidence, ^{it's} indirect

evidence. No one has ever been to a black hole. No one has ever held in their hands or really definitively detected subatomic particles. These are detected almost by shadow and by inference. And yet, they are established as scientific proof, and it's part of the scientific understanding. Now, how strange it is that thousands of photographs, pilot encounters, landing traces, eye witness corroborating testimony, and so on does not constitute sufficient evidence. This has nothing, therefore, to do with scientific evidence. Again, it has to do with prejudice. As we attempted to assemble this body of evidence we kept that in mind, realizing that the absolute best evidence and proof was something not altogether available to us, although some of us have seen it. So, the evidence that we are presenting is a sampling and distillation of the best evidence that we could find from throughout the world. It is not necessarily even the best that can be presented even in this format. Because what we wish to do is to have samples from throughout the world. And this builds into it another intrinsic integrity to the evidence pool. Because many people will say, well, this sighting and this event was the testing of an advanced US craft, test military vehicle. But when you find the same object photographed 30 years earlier in Portugal or video taped around a volcano in Mexico, or having landed on a ranch in Argentina, then you find that that ability to rationalize and dismiss it is greatly diminished. So, for that reason the best evidence being presented here is representative from around the world. And for that reason we made great

efforts, also, to go and find evidence from throughout the world.

To those who would say that this simply isn't enough, and they are not convinced, we would say, that's OK. So long as you maintain an open mind and continue to investigate, because as was shared earlier, if all of this evidence constitutes only a ^{ten} 10 percent likelihood that extra-terrestrial life forms are landing on terra firma, the implications of this are so profound that we dared not ignore it, ^{ec} No matter how unlikely the evidence may seem.

Finally, before presenting the bulk of the evidence, it is important to recognize that an inter-planetary civilization, and, in fact, a star-faring civilization will not manifest the way twentieth century human technology is manifesting. By definition it will be esoteric, ¹ and ^{and} By definition it will appear to be magic to us. As we go through this evidence, this principle will be brought to the fore over and over again, because it is critically important for us not to dismiss evidence because it doesn't appear the way a jet fighter or light bulb or cellular telephone appears. ^{To it} Put in perspective, go back 500 years, ¹ and show the people of North America or Europe a light bulb, a flashlight, a telephone, a television, a laser, a hologram, an article of clothing of synthetic material; it would all appear as absolutely magic. In fact, if you showed it to the right or the wrong culture, ¹ should say, you

would probably be burned at the stake as a witch for having ~~flashed~~ ^{focused} that flashlight at them. It is an incontrovertible fact that any civilization advanced enough to travel through interstellar space and get here will have technology that will look like magic to us. And so, we have to maintain an incredibly rigorous open mind as we look at how these life forms might manifest and to ~~be~~ ^{be} very restrained in jumping to conclusions about their technology or about the people who are inside these spacecraft. We have often been out on research events with people who will see one of these objects and it will suddenly "disappear." And the majority of people there will say, ~~oh~~ ^{oh}, it disappeared, it became unmanifest; which is sort of a magical explanation of something we don't understand. But what if the object went from hovering to several million miles per hour instantly, ~~did not~~ ^{did} accelerate gradually, but instantly ~~with~~ ^{from} from being still to that velocity. The human neuro-pathways of the eye and the brain simply cannot track that kind of acceleration. ~~So~~ ^{So} it would be there, then it would be gone. This is an example of how we have to be restrained so that we avoid jumping to conclusions which are unwarranted and unscientific and, quite frankly, illogical. On the other hand, there are aspects of this technology which really are magical; at least they appear that way to twentieth-century science. Ironically, an aboriginal in the Outback of Australia or a native in the Yawnamano of South America would probably be able to understand it better than a modern scientist. The reason for this is that the technology

of these spacecraft and of these life forms, by virtue of their capacity to travel throughout interstellar space, is non-local. The technology itself is accessing aspects of matter and aspects of what we call mind or thought which are essentially non-linear, and therefore can be extraordinarily confounding to a linear, reductionistic, mechanistic, rational, twentieth-century scientist; but would make probably a great deal more sense to an aboriginal in Australia.

These comments are shared so that the evidence presented will seem a little more approachable and a little less confounding. But a great deal of humility is called for as we look at this data and as we look at the evidence of something this extraordinary from our current level of scientific knowledge. Would anybody 50 or 100 years ago have foreseen cellular telephones and satellite TV? Would our great-grandparents have imagined that we would have gone to the moon and would fly transcontinental distances as an everyday event? As we look at the potential of technological evolution into the future, we need to only look back 100 years and see how far human technology has advanced to see how extraordinary a technology which is 100,000 to 1,000,000 years more advanced than ours might be. We are conservatively estimating that these technologies fall into that timeframe of advancement beyond the current state-of-the-art on this planet Earth. So, as you look back 100 years from horse and buggies to

walking on the moon and space travel, extrapolate that into the future 100,000 or 500,000 or 1,000,000 years. It is mindboggling. And so, it is with that in mind and with a deep sense of humility and restraint that we must view the manifestations of these spacecraft and the people on them.

We will go this
~~This will be gone into~~ in greater detail in a later Chapter ~~later this week~~. I think that concludes my introductory comments for BAE. Are there questions up to this point on the topic related to what the comments have been in the last ~~2~~ *two* hours?

Q: What exactly is empirical observations?

A: Empirical means something that is observed in real time, like Newton seeing an apple falling out of a tree. That is a direct observation, or empirical measurement. Something that you can see and measure ~~and what have you~~. That is really the foundation of scientific discovery.

Q: You referred several times to covert groups, and I kept thinking you were going to say more at some point and throughout the hour and a half you were just talking about covert groups.

A: Yes. Later there will be ~~2~~ *two* entire chapters dedicated to discussing the history of how this ^{issue} ~~thing~~ has been managed, and also the nature of the covert entity which has been responsible for it. And so, I would like to defer it until that timeframe.

Q: I have a question about why they would be interested in speaking or dialoging with us if they are that far ahead of us. *(dialoguing preferred usage)*

A: That is a very good question. *but* I think it needs to be saved for a later point. *Let me comment on it briefly, just in case no one asks at a later point this week.* The question is, if they are this advanced technologically, why would they want to dialogue or observe or visit this planet. This will be dealt with in detail *when* ~~after we take a break, where we look at the overall~~ assessment of this issue and what's been going on. It really speaks to why are they here; *what not* on this Earth would motivate advanced life forms to have any degree of interaction with this planet. And that will be addressed in about 10 minutes.

Q: If a framework based on physical laws were used for making, taking action and the scientific community is not that reliable, maybe it won't be able to agree even on what's basically law.

A: Was that a question?

Q: Question and comment, both.

A: The comment was that will the scientists even be able to agree on the physical laws involved with these manifestations of these. *And I think* the answer to that is *absolutely not*. *And these* is tremendous controversy; we will get into that in a later Chapter, as well, regarding how people view this entire subject. There has been a tendency, for example, to put it into the realm of the occult or the esoteric simply because *science doesn't* we don't understand

the laws that are operating around these spacecraft. And yet there is an
 inherent problem there. And that is, things that are not of a material nature
 don't crash in the desert and the bodies don't rot and get eaten by coyotes,
 which has happened in this area. And, so, we have to find some way of
 evolving a paradigm that accounts for all of this seemingly conflicting and
 paradoxical evidence. But I think it is important; it is a very good point; and
 I would like to comment for just a moment. We have to recognize that a
 very small percentage of the actual physical laws of the Universe have
 been elucidated by 1995. We cannot assume that the book of all
 knowledge is closed. This is why it is so preposterous for scientists to say,
 well, they can't get from there to here, because the distance is so great that
 at sub-light speed it would take longer than a life span to get from their star
 system to this star system. But this is patently absurd, and anthropocentric,
 because it is assuming that the laws of physics that might permit inter-
 stellar travel and therefore what we call trans-luminal velocities, beyond the
 speed of light velocities, don't exist and cannot exist. And that we in 1995
 have discovered every law of the Universe and know everything that there
 is to know. Now, scientists, if it was stated that way, would always say, oh,
 no, of course we will discover other things. But, the way that they act, the
 behavior of science is usually based on the fact that we know everything
 and what we don't know isn't real. And this has, again, more to do with the
 psyche of humans and an ego attachment to current knowledge than it

does with the truth of a subject like this. Because there is no way that in the short amount of time that we have anything resembling technology, that we have mastered all the physical laws that ~~there are to be mastered~~. And

~~even~~, ^{now} theoretically, scientists are beginning to see that by adjusting, for example, a gravitation field, that you can bend what we call space-time. So that the distance, instead of being 100 light years, might be half a light year.

And the amplification of gravity waves, for example, through such technology could completely alter what we would normally think of in terms of the restrictions on linear travel as defined by Einstein's physics. There

will be much tearing of cloth and wailing over how these spacecraft are getting from there to here. But it brings up a very important point. And that is, a genuine scientist does not look at something and say, "I don't

understand how that can be and therefore it doesn't exist." A genuine scientist looks at something and says, ^{well}, there it is; now, let's see if we can unravel the mysteries behind its existence." Put in a more prosaic way,

if an aboriginal in Australia were to see an F-16 fly over, an irrational response would be, well, I see it and I hear it, but because I don't understand how that much weight can be moving at Mach 2, it doesn't exist.

An equivalent thing is happening in this area in the scientific community, where they, even when confronted with the evidence, and undeniable evidence, will say, ^{well}, it doesn't matter. It can't exist because we don't understand how it could exist and therefore it doesn't exist." Well, this is not

science, it is pseudo-science; and it is something which is surely going to have to be altered. It's more related to the religious persecution of Galileo than to any real scientific enquiry. And, so again, the mother of scientific discovery is empirical observation; and it is not for the observer to say, "I do not understand it therefore it can't exist." It is for the observer to say, "there it is; now let's see what we can discover about it so we can understand how it exists." That is how the great advances of science have happened, after all, over the last several hundred years. And it should be no different in this area. But, again, it's the issue is less one of scientific rigor than of psychological denial. Because for scientists to admit that they are staring at technologies that far advanced and that far beyond our current understanding of the physical laws of the Universe is an extremely humbling experience. And, in general, authorities, experts, and scientists do not like to humbled.

Q: May I just point out that in the 1840's there was a serious move by the federal government to close down the US Patent Office because it was generally thought that everything of importance had been invented by that time.

A: The comment was made in 1840 there was a move to shut down the US Patent Office because it was thought at that time everything of importance had been discovered and there would be further significant discoveries. It is a truth that every generation of scientists unwittingly puts

themselves on the throne where they think that they are at the summit of all knowledge. Of course, only to be knocked off that throne by the next generation, [↑]or the next day, [↑]as knowledge is exploding ~~now~~ ^{and} as new discoveries come along. I think anyone who would look at the history of science and technology would have to admit that this is a very real dynamic and one which we must begin to come to grips with as we look at ~~this~~ ^{the} extraordinary body of evidence, only a scintilla of which is going to be presented here.
